BTW bury 'em if you have to, but an inch is deep enough. Beyond that losses will ensue--particularly at higher RF.

>
>Basically, would I be better off mounting the vertical on the ground rather
>than adding, say, 10-20' of elevation?
>

Doesn't make a lot of difference (except for construction) below
the 20 meter band. 15 meters and above, going to higher elevation
is advised.

>How well will ground mounting work to eliminate the need for radials?
>
Radials should never be eliminated. I often wonder why so many
amateurs, even those not limited by geography, resist the idea
of radials for a vertical. These same amateurs would not
consider for a moment putting up a horizontal antenna with
a 1/4 wavelength on one side of the "center" feed point
and something considerably less than that on the other side.

Yet that is exactly what the situation looks like to a
1/4 wave vertical with a less than ideal ground plane
(with an added loss penalty, besides).

Steve, N2IC/0, asked me to post this:

As long as we're into bragging ....

K1AR (multi-operator/single transmitter):

4445 QSO's
170 Zones
706 Countries

11.2 M points - a new USA multi-single record !

This was done using K1EA's station, and, of course, CT software (written
by K1EA).

A few relevant comments:

- The YCCC packet network had over 3000 DX postings during the contest.
- K1EA's station had the least amount of inter-station interference I have experienced at a multi-station. Ken sure knows how to build stations !
- We were beta-testing an Alpha 87A, automatic bandswitching/automatic tuning amplifier. What a great box for the multiplier station !

The operators were: K1AR, K1EA, KM3T, N6BV and N2IC

WHAAT??!? Bob McGwier, the DSP whiz is into HF CONTESTING??!?!?

I see all the posts on here from folks who want to dump the code, and say they are only interested in being on the "cutting edge" of technology. They usually characterize HF contests as a "waste." Now we find out that N4HY, besides being on the frontier of new ham technology, is also particitpating in the CQ Worldwide DX Contest!

Gosh, it's nice to see that Bob has broad interests in radio.
(Bob, I am not flaming you!)   :>

This month I'll be listening for PHIL KARN in the ARRL Sweepstakes!

Great showing in the CQWW, Bob!

An interesting leap in "logic" ..... Herbster passed the Morse test, and
because he gives some opinions that the "dump CW" crowd disagrees with,

THEY act as if the Morse test was was HIS invention, foisted on THEM!

When the this silliness is pointed out, comparisons to HITLER are made!

Now I learn that because CW is not "utilitarian" enough, it is IMMORAL!

Hey, Gary! I think you missed one. But maybe you classify it as one or the other of the above two you mention. Could you tell me which?

A system that (typically) uses technical access controls and is stated as being open to all. However the access controls are periodically changed and/or individualized. They are NOT published in the open, but are given to any ham who asks, though not over a radio frequency. The exception is that when someone abuses the system (leaving the definition of that out for the moment) their

  access is terminated my one means (changing the access codes and
  not telling this abuser) or another (disabling his individualized
  access codes).

I am planning for my NON-REPEATER autopatch to have access codes
like this. Unlike a repeater, it will be relatively easy on the
users to have to enter a DTMF access code of 5 or 6 digits that is
their specific one. The controller I am looking at getting is one
intended for commercial use with paying customers and has this
individual capability.

First of all I am not saying that I am opposed to no-code, but this quote
above made me think a little bit. Brandon wants proof. Well, I want proof
that a no-code license will have the desired effect. In business you do a
market study before you put a product out.

Personnaly, I think that all the excitement about no-code solving HAM radio's
problems may be somewhat unfounded. No matter how good of an idea I might
think it is.

Why not....

```
     Class              Elements            Options

     Novice             2                   CW 5 WPM

     Technician         2,3a                Pick (2) from list below

     General            2,3a,3b             "    (4)   "    "    "

     Advanced           2,3a,3b,4a          "    (6)   "    "    "

     Extra              2,3a,3b,4a,4b       "    (8)   "    "    "

     Communicator       2,3a                * (required)
```

[list in previous posting]

But then do we even need communicator?

This proposal, however, has problems:

1. A tremendous new burden on the VE/VEC's to develop more tests (but I actually believe we need to revamp the who testing anyway).

2. The issue of international requirements for a Morse exam for access to frequencies below 30 MHz.

>them) that you will use in the future eh?

Have you been hiding for the past several years? The issue is whether or not a Morse Code test should be a part of every possible means to get access to a public resource, part of which does not have any need of that skill whatsoever.

Here is this public resource, the amateur radio spectrum. Many people would like to make use of this spectrum for reasons consistent with the designation of this spectrum allocation. Some people hold the belief that no one should be allowed any access to this spectrum at all unless they conform to a certain set of radio operator skills, notably the skill to copy by ear the Morse code telegraphy code. This is a skill, albeit a worthy an honorable personal achievement, that no longer has the appeal it once had since so few other services use it anymore.

This is all occurring at the same time that other radio services are experiencing tremendous growth patterns and have a level of spectrum crowding within their own service allocations many times the density level of that portion of ham radio that most closely mimics their usage patterns, voice repeaters and packet radio. From the point of view of almost everyone outside amateur radio, we are wasting this resource.

If we really are not going to make full use of the spectrum we have, then we should just turn some of it back over to the FCC now and just keep what we can use.

On the other hand, we don't have the numbers yet to make full use of what we have. A great number of the 488000+ hams are either inactive or are primarily users of HF (whose threats are more political than numeric). There are too few hams to hold down the vast spectrum we have in the VHF, UHF, SHF and EHF areas. We need those numbers if we are going to keep this spectrum. Perhaps we only need to double the number of hams now on these upper bands. That's not doubling the 488000 figure, but rather a doubling of just the small portion that is there now. If all of the 488000+ hams were activated and operated on the VHF UHF bands, we would no longer have this threat. But that is not every hams interest.

Then there is the issue of whether or not the government should be letting those who happen to have use of the spectrum now dictate the measure of how to let others access that spectrum in the future.
If we don't straighten ourselves up, we may find someone like Congress doing it for us, their way.

I don't use CW either. But I can't copy anymore anyway, so what does it matter for me. I think there are a LOT of hams like me, who have just forgotten the code because they learned it just enough to get by the test (and 5 WPM is nothing but a token effort). Many of those who are not getting into ham radio are avoiding it just because of the stupidity of even a TOKEN effort to learn something they will not and probably cannot use.

>   Would you rather that the user learn CW only AFTER he decides to get

I'm on the frequency, but if I am going to relearn CW, it obviously is going to be AFTER, since it is already AFTER.

Not true. A simple statistical study of time usage of each mode would give a fairly accurate probability of use.

Personally, my probability of use of CW is less than 0.05 empirically from my home station, and less than 0.01 from W6YX. On VHF, it's about 0.05, and above VHF, zero. That's based on about four years of operation.

Projecting into the future, my use of CW on HF will continue to decline
(most of my CW QSOs were early on when I had a tech license), but will
probably stabilize at VHF...

In contrast, nearly 90% of all of my study time for the exams was spent
learning CW.

>The assertion that CW is "efficient" should not be a matter of
>opinion; it is a testable statement falling within the domain of
>information theory. If knowing that is elitism, then ham radio needs
>more of it.

That depends on what you call efficient.

CW is SLOW. Machine generated and machine decoded CW can do a marvelous job of efficiency, but that is limited to machines only (and certainly does not apply to testing the carbon-based units). The Morse Code itself is inherintly an INefficient code. It requires more bits to send the information, with no means to recover the excess.

When we are dealing with strictly human operators of conventional analog radios, CW definitely has some advantages. But these advantages are realized just BECAUSE CW is not efficient. It is REDUNDANT, and that helps it get through the noise.

>I invite anyone who thinks CW is really spectrum-efficient to give me a
>call next time you're in LA. I'll take you over to meet some people
>from the JPL Deep Space Network. They're the world gurus of weak signals,
>and they do it all with "Belcore (sic) PhD elitist crap".

You can make CW spectrum-efficient, but you could do that with ANY code. Morse (as opposed to CW) is not an ideal coding system for machines, and so Morse code CW never will reach the ideal, but can can be made quite impressive.

But that which makes CW impressive does not apply to test PEOPLE's skills.

>And before anyone feels the need to point out that the DSN isn't ham
>radio, yes, I know it isn't. But CW either is or isn't efficient, and
>people who understand the question say it isn't. CW does have the
>advantage that it can be decoded by ear by a sizeable group of people.
>In other technical respects it's unimpressive.

Machines can decode Morse code CW quite impressively.

Humans can decode Morse code CW, too.

Many humans are not interested in Morse code CW, and think it is not relevant.

Machines don't and can't care, so do go on FORCING MACHINES to do code.

>If you like it, use it and be happy. Don't expect everyone to think
>your reasons are compelling.

Or if you don't, don't use it, and be happy.

But what about the ones who don't want to before they have a license?

And you heard this on a CW net I bet.

This is a totally bogus argument. If by virtue of there being no requirement, people are deprived of the choice, then we need to start requiring EVERYTHING THERE IS.

My parents forced me to try a LOT of different foods as I grew up. I found that I ended up DISliking most of the foods they forced on me. I ended up LOVING other kinds I never had as a kid (e.g. Chinese, Indian). I do believe that had I not had these things forced on me, I would not have such negative feelings about them

While in junior and senior high school, I had literature FORCED upon me by the English class curriculum. In grade school I loved to read fiction, able half being science fiction. But after my experience in high school with literature being forced on me, I ended up so disliking it that I no longer read fiction at all. It just feels so bad to me to do so.

And you tell me that forcing things on people is GOOD? No way!

>Now here's something you can flame me for...I think the no-code attitude is

Now here's something you can flame me for...I think the pro-code attitute is
selfish and arrogant. You want to keep ham radio stuck in the way of the past
that will doom it. You may have the best of intentions, but I don't think you
know and understand what the future of the hobby has going for it in the next
fifty years. The loss of valuable spectrum we can see each time the FCC says
something is a direct result of the lack of growth because of efforts to keep
out anyone not willing to become like you. So what conclusions can I draw?
I work VHF, UHF, and planning to go digital, and am also interested in VHF
thru SHF SSB and CW and I am appalled by what I hear. How can I not associate
a "stick to traditions only" thrust with a knife in the heart of the Amateur
Radio Service. I hope I'm wrong. I hope I'm just paranoide. But why do I
keep spinning the dial down to the HF bands and hear people who make me feel
bad instead of feeling profoundly proud?

Could this be because you talk mostly to CW operators? Most of the posters
to this net who support mandatory Morse testing claim that Morse is easy
to learn and that anyone can do it. When you poll people at a Baptist
tent meeting, most of them will tell you that only Baptists are going to
heaven. If you poll the general population, you will get a different answer.

The fallacy of polling amateur operators about CW is that you are polling
a self selected sample and are ignoring all those who tried to become
amateurs but failed due to the Morse requirement.

>Now here's something you can flame me for...I think the no-code attitude is

I think you are wrong. The deterioration of good manners among younger people
is a reflection of society in general that has nothing to do with CW. Remember
that all the bad operating practice that you hear today is from people that
HAD TO PASS A CW EXAM. In fact some of the worst offenders hold Extra class
calls.

One of the reasons that the operators in the CW subbands are marginally
more mannerly is that many of them are older and were raised in a more
mannerly society. Another reason is that the communications rate is so slow
that real flamefests are hard to maintain.

Amateur radio needs explosive growth in the UHF and Microwave spectrum to
have any hope of holding on to these allocations. Amateur radio needs a
"critical mass" of operators in the UHF/SHF bands to support real computer
networking. US society needs more people with an interest in technical career
fields. Hooking more people on a technical hobby is instrumental in steering
them to a technical career. Saddling potential recruits with a requirement to
learn a mechanical skill most of them consider mere hazing is counterproductive
to these goals.

I consider it neither selfish nor arrogant to be willing to accept crowding
and some obnoxious behavior on my favorite UHF/SHF bands as part of the price
of achieving the goals of saving the bands for amateur use and interesting more
people in technical pursuits.

You and who else?

Actually I did not suggest (yet) assigning them by request, but just go
back and assign the old unused ones at random.

But if there was an assignment process, that would be OK.  There should
be SOME way to get access to those calls.

But I think that getting a callsign by request should be PAID FOR.  It is
no different than a vanity car license plate.

>
>Does anyone have relevant experience with PA systems for modest-size

>groups? We don't want a bull-horn, and don't need rock-band volume, but
>want good fidelity and enough volume to handle say 100 people inside a
>community-center-type room (typically hard walls, tile floor, acoustic
>tile ceiling).

There are numerous tradeoffs in a PA system. The fidelity/cost tradeoff is one of the toughest. First let me urge you to avoid wireless microphones if possible. Good wireless systems with diversity receivers and using crystal controlled clear frequencies (requiring a license) are very expensive. Nothing less is satisfactory except in rare conditions. Without diversity reception you will have null zones with sudden fades and odd noises. Without crystal control you will have drift problems similar to those you described. Expect to pay upwards of $1000 for a decent wireless microphone system.

If possible use a podium mounted stick mic such as an Electro Voice EV635, this is the best all around microphone you can buy. It's extremely rugged, you can drive nails with it, and it has good voice fidelity. Most broadcasters use it. If the speaker must move about, use a lapel mic like a Sony ECM50 or let him hand hold the EV. Using a hand mic properly is a skill that some speakers find difficult to master. These are professional microphones in the $50 to $90 dollar class.

For a hall holding 100 people you need an amplifier of about 50 watts. With very efficent speakers you can get away with 20 watts. You will need an equalizer to balance the system and prevent feedback. Bogen makes a suitable amp for about $150. If the PA is to be a permanant installation, ceiling mounted speakers sprinkled about the hall are best. No one gets blasted and people in the back can hear clearly. Cost will be about $10 each for 5 inch ceiling mount speakers and 70 volt line transformers. Otherwise you will need two or three floor standing speaker cabinets. If you want good fidelity, and you do else feedback becomes very difficult to control, these can be very expensive. Expect to pay at least $150 each for floor standing speakers. You can make suitable speakers yourself out of plywood and speaker components by EV or even Radio Shack. Cost about $50 each.

An empty hall and one containing 100 people have very different acoustics. Try to get some volunteers to sit in the seats while you are equalizing the system. Otherwise you will be unpleasantly surprised. Also a system that sounds plenty loud in an empty hall will be inadequate when sound absorbing bodies are present. Try to do all your testing with the hall filled.

So with care you can put together a system for around $300 that will do a fine job. Get to know your local sound reinforcement technicians and the distributors where they shop. You'll learn a lot.

>forever indebted!

I would suggest that you use a comparator IC (LM-339) as the input to the desired circuit. This can be connected directly to the audio output of the radio and use a voltage threshold to determine where the comparator trips. For a reference on this part, look in the National Semiconductor Linear Databook. The output of the comparator will be a square wave driving an open collector output of the comparator gate. Use a 1 Kohm pullup resistor to your supply on the output to create a TTL-compatible signal. Run this into a re-triggerable one-shot such as the 74122 or 74123, available from several vendors. This is a TTL IC that can be used to stretch a pulse from a narrow width to a wider one. You should pick a time constant value is about 2.5 times the time period of the incoming tone. This will cause the output of the retriggerable one-shot to go high and stay high during the presence of a tone and drop if the tone is missing for two or more time periods. This will will be the desired signal you need to feed into your CPU. Now, you just have to convert from TTL levels to RS-232 levels. This can be a bit tricky, but using a chip such as the MAX-232 from Maxim or equivilent parts from TI or Motorola will do the job. The problem with this level conversion is that you need +/- 15 volts, which is not usually available easily. The chip mentioned has an internal converter that generates the required +/- 15V levels internally and uses it for the RS-232 drivers. It also has some line receivers that convert from RS-232 levels to TTL levels. Finally, connect the RS-232 level outputs to your PC and have some fun!! This project will require 3 chips, two of which are pretty common. The MAX-232 chip may be a bit tough to obtain, but call a Maxim distributor or rep in your area and ask for a sample or two. This circuit will work on 5 volts DC, which I assume you have available for your use.

>Actually, if you look back at the various messages on the subject,
>nobody has suggested denying morse to anyone, just not requiring it.
>It's misunderstandings like this that contribute to the problem.

Let's look at the extremes:

ONE EXTREME:

Force every ham to learn Morse code

OTHER EXTREME:

Deny every ham the use of Morse code

MIDDLE:

Let every ham choose for themselves

> Not too shabby. Haven't heard the total from P40V yet.

The outcome of the PJ9W vs. PJ1B competition is an example of how operator skill and team rhythm can overcome hardware factors. The PJ9W crew put on a tremendous effort and are to be commended. They had on the order of 100 operators/workers on Curacao and very impressive hardware, including a FULL-SIZE 3 element rotary yagi antenna for 75 meters.

Why they lost I can't be totally sure. And in the grand scheme of things it doesn't really matter. But I know many of the ops who went to PJ1B and I know they know how to operate. Additionally, they have operated from that part of the world many times more than most of the Finnish ops who were at PJ9W.

Both the PJ9W and PJ1B multi-multi teams are to be commended for two fine contest efforts! The CW competition should be an interesting one!

I don't think that's what he wants. But I think he realizes we have to do something at minimum would approach that for a while lest we find cellular phones operating on 1240-1300 MHz, and many other services that ARE GROWING taking THEIR SHARE of the whole spectrum from us hams who won't use what we got.

Just to set the record straight:

There is NOTHING WRONG with liking Morse code. Lotsa people like Morse code.

But sometimes some people are expressing their opinions about the "no code" issue and mixing in the "I like" or "It's fun" points, and then someone else reads that and can't separate the issues.

If someone out there believes that liking Morse Code is a bad thing,

```
please state that clearly then get your asbestos ready.

The October 1990 issue of '73 magazine has an article on a hardware/software
sharware product called "Robo-Copy".

There is a schematic for building a receiver -> PC serial port interface
and an address for the software.

You can receive the Robo-Copy program (and it's 'C' source!) by sending
$5.00 + SASE + 1 formatted floppy (5" or 3" your choice) to:

Mike Hansen/WN9DYI
1405 Tanglewood Drive
Algonquin, IL 60102

Robo-Copy, a descriptive text file, and the 'C' source are also available
from the '73 bbs under the 73MAG SIG. The bbs number is (603) 525-4438

Robo-Copy is not copy protected and may be copied and distributed freely
for private use only [so says '73 magazine].

I'm attempting to interface this code to a Farallon MacRecorder (for the
Mac, of course). Should I ever get some free time, I'll post my results.

Rick

Have you looked at the November 1990 _Popular Electronics_?? There is an article on a 'radfax' decoder that seems to be able to handle radfax, RTTY, and Morse code also. Then again I could be totally wrong because I don't know my head from the proverbial whole in the ground... It seems, however, that (even though the article stresses that you should by some software from Australia) you could at least get some idea's as to how someone else attacked this problem. I seem to recall that they used an IC called a XR2211 FSK demodulator. FSK means Frequency Shift Keying, like the ON/OFF of Morse code, eh? I would suggest taking a look, however, because my neophyte brain is probably mis-interpreting the whole thing...

tima@agora.hf.intel.com

PS: Can I trust Panaxis Productions with a credit card number? I want to buy some 'educational' material along with a subscription to Electronics & Radio Hobbyist's Newsletter. No one seems to be at the other end of the phone, and I'm always a little cautious when it comes to things that are for 'educational' purposes...

I think you will find that re-learning it is MUCH easier than learning it the first time. Not quite like learning to ride a bike, but similar.

Help needed !

I do have a problem.
Does anyone know how to skip channel in IC-SE (U.S. IC-2SA) ???
It would be nice to get other info about that rig (extended freq.range
etc.)

Please e-mail answers

In my search for the perfect ground floor condo vertical, I have come up
against a question. Being inexperienced with HF verticals, I'm wondering how
well earth ground really works.
I can probably bury a limited amount of wire, but not nearly the length
required for 20-40m radials.

Basically, would I be better off mounting the vertical on the ground rather
than adding, say, 10-20' of elevation?

How well will ground mounting work to eliminate the need for radials?

Thanks,

73 de Mark

This is in response to a posting by Mark. I have a similar problem.
The solution: The Ramada Resonator- an article in 73 about 5 years
ago.

The antenna consists of a Slinky (about $4.00- if you can still find the
metal ones) elongated along a piece of PVC or wood. Feed it like a random
wire from your tuner. Be sure to use a counterpoise ground, as a minmum.
I have also fed it with coax, with the shield going to a "radial" which
I through around the backyard.

The antenna loads from 160 to 10m- gets a little finnicky (High Q?) on 80
and 160, and a little hot on 40- I can probably fix this by changing the
length of the feed wire.

For a ten buck investment, I am on the air and work DX with it from my
antenna resticted townhouse. This might be something worth looking into.

Peter J. Stopa, KA3LKQ

Richard Kronstad---I have the manual that came with the HQ-129X, which is a receiver not a transceiver. lI would be glad to send you a copy. It isn't very long.

While we are on this topic, does anyone on the list have a suggestion for a place to buy/sell old tube equipment like the HQ-129X, Hallicrafters, etc.? Thanks for suggestions.

I see alot of different short mobile antennas which have a helical section and a straight section. And there seem to be many variations of this design, especially with regard to the total length. Are these all for cellular phones? If not, can one tell from the appearance what bands they are operating in? Some of these have a large base containing (I assume) a loading coil. Can one only guess at what they are running?

Thanks in advance.

I would like to propose a new news group:

rec.ham-radio.endless-cw-debate.

I get the impression that there is probably a majority of readers in rec.ham-radio that feel the same way as I do.

I for one am tired of the endless ranting and raving about this topic which in all probability does not have an ending. Perhaps we need an acronym for this topic just like the rec.humor readers made with YALBJ (Yet Another Light Bulb Joke) - insert YA..CW.. here.

Okay, I could start a Kill file, or just shut up and live with it as many are already doing. On the other hand, since this is a place for expressing opinions, then now is just as good a time as any for me to express mine:

> The CW topic is completely worn-out, unresolved and emotionally charged, much like a religeous debate. Why don't we get back to the fun part of this newsgroup and just give it a rest? There must be other more interesting things to discuss around here. How about it?

To those anti-coders who note that I'm an Extra and would prefer to flame me by direct e-mail, don't bother, you're wasting your time as well as mine. I've had the same dumb experiences in getting there as everyone else. My general views on the subject are liberal and so I won't bore you with them. My point is that this subject has gone virtually nowhere in the past several years so why not let it go the way of the previous rathole discussions like:

Pizza via autopatch
Transmitting out of band (Let's hope it's dead)
etc.

C'mon folks, let's dump this and get on with having some fun!

73's, -fred

>
> The No-Code people are advocating it's elimination from the test, not the
> banning of CW. The Pro-Code people equate non-testing with forbiding it's
> use.

The no-code arguments I usually hear involve the creation of a license that has no code privileges. This is forbidding the use of code to those who have a no-code license, just like techs are forbidden to use voice below 6m. Thus, it is most no-code people who want a prohibition on code.

If the guvviment gives you a code privilege, it should test you on it to make sure you have rudimentary ability to use it. Just like the privilege you get to build your own radios has a test to make sure you have a rudimentary knowledge of how to do it. Or at least how to keep from burning up a lot of valuable electronic parts in the process.

WARNING WARNING Facetious paragraph follows...

Aha. Many hams don't build their own radios. Let's create a non-technical license, in the ham bands, for people who buy everything off the shelf. Allow no technical changes or construction. Just plug it in and Yak Yak Yak.

END OF FACETIOUS PARAGRAPH.

> If anyone wants to learn it, fine, but I still haven't seen any LOGICAL

> reason for making everyone do it.

1. If the privilege exists, it needs to be tested to some low level so the learning takes place on a practice oscillator instead of the airwaves. If you think 5 wpm is slow, what do you think 1 wpm would sound like?

2. The international treaties governing radio demand it for activity below 30 MHz. As all current ham licenses have privileges below 30 MHz, it is required for all current ham licenses.

If you want to create a special no-code license, these reasons are not relevant. However, as you seem to want just to eliminate it from the test without prohibiting its use, they are both logical and valid.

FLAME WARNING: this is neither support for, nor argument against, a NO-CODE license of different privileges than current licenses. It is an argument for the continuation of CW testing for the current licenses. All flames, either way, may be sent to /dev/null or NL:.

Please keep track of how many courses you are REQUIRED to take there at
Stanford (assuming ur a student). In abt 20 years please post to the net
how many of those (forced) learned skills you are or are not using. If
you find that you are not using most or all of them does it also follow
that Stanford as well as all other universities etc. which require certain
minimum requirements to obtain a diploma are also "from a utilitarian
standpoint" immoral and possibly criminal? (-;

Lava beach, Jerry, I expect. :-) :-)

The claims are a little farfetched, I agree; but not *that* farfetched, IMHO. Notice he mentioned 4m (!) of space. Heck, that is 0.2 lambda at 20 meters. Notice that the ad emphasized the size of beams by saying that they are tens of feet in size and casually saying that you "only" need 4m of space for the loop. In the same vein, can I claim that a 5/8 wavelength vertical for 20m only takes a square foot of ground?

A vertically-mounted small-loop has the same directivity pattern as an E-field dipole (honest! only E and H terms are swapped). A 4 element Yagi-Uda has a, what, 8-9 dB gain over a dipole?

Notice that a 4m by 4m loop will have an equivalent small-loop radiation resistance of damn close to 50 ohms. Granted, at that size, 31200*(A/lambda^2)^2 (I think that is correct, A = area of loop) no longer holds; but it is an indication that loss resistance is now quite well controlled; and thus the loop efficiency can be quite high.

A 9 dB difference is about 1.5 S-units.

Don't knock small-loops, as long as it is not *too* small :-). The lambda^4 effect is quite amazing. Using the radiation resistance equation above, and assuming that it is a square loop that is m*lambda on a side, we get

m (in wavelengths)	radiation resistance
0.05	0.2 ohms
0.1	3 ohms
0.2	50 ohms.

I tend to believe that it is going to be difficult to get a decent efficiency out of the 80cm loop mentioned in the ad. It is a little smaller than .05 lambda at 20m. Interesting that this is about the size of the AEA Isoloop, eh?

I have started to play around with small loops, comparing them against the physically-small helical antennas that I have played with before this. Living in an apartment (flat-dwelling, cliff-dwelling, call it what you want :-) makes experimentation with physically-small antennas a neccessity .... ..

> None of your points constitute valid arguments against a codeless license,
> although you are perfectly free to promote voluntary proficiency in or
> use of CW by anyone who will listen.
     WHERE IN THE HECK DID I EVER SAY THESE WERE ARGUMENTS AGAINST THE NO
     CODE LICENSE???  Someone asked "what was so special about CW" and
     i answered it.  I feel it is special and stated why.  I couldn't
     care less whether there is a no-code or no-exam license unless in
     imposes on my enjoyment of the hobby.

     Why do the no-coders get so paranoid and uptight at the slightest
     mention of CW??  Its not the "boogie-man" guys.....

No, it's true. I've been using a magnetic quarter wave antenna on
2 meters for years. Performance is <identical> to a similar non-
magnetic quarter wave whip.

Conservative of spectrum would be more accurate. It is efficient
ENOUGH for conversation. I do not think speak or read at 9600 baud
so why should i use more spectrum than is necessary to have a casual
conversation?? Of course my little FM dual-bander sure does sound
nice. Makes autopatching more conveneint :-)

> Moreover, this doesn't demonstrate a requirement for all hams to know or use
> it.

Nobody said it did!! More paranoid whining. All i did was answer a
question and i get accused of   "shoving CW down throats". If the no-coders spent 10% of the time wasted on whining about CW into learning
it, they would all be at 50wpm now.

> +---------------

Yes, lets get to nit picky extremes. Anything to slam the CW boogie
man. I think most readers got the point. It is the easiest mode to
put a station on the air for. BTW: AM is an outmoded archaic form of
communications.

> | 3)   FRIENDLY. CW at 15wpm+ lopes along at an easy conversational pace

> Good. Now why does this apply to ALL HAMS ALL HAMS ALL HAMS ALL HAMS ????????

Didn't say it did......(paranoid whining...)

> The favorite straw-man tactic: tell us why it's good in and of itself, not

     Where is the skill in talking into a microphone??  We all know that
     CW is more of a skill than any voice mode or the code bashers wouldn't
     be whining so much about it. :-)  (better not forget the smileys this
     time or someone may take it serious)
> And please demonstrate that this applies to all hams, and that this is the
> ONLY way to gain a sense of accomplishment and satisfaction.
     No.  I see no need to bolster an argument i never made.

     I sure hope all the future communicator class folks are not this
     nit-picky-defensive-condescending-rude on the air.....I prefer
     casual friendly conversation.  All this whining is tiresome.  In the
     future, i would hope that the paranoid no-coders would actually READ
     a posting before making conclusions as to the poster's political
     stance.  Show me where in my original posting that i said ONE thing
     to deserve all these accusations of "shoving code down throats"??

     Many thanks to Tad Cook for providing some sanity to this group.

HELP!!!!!!!! I am looking for a MARS operator that is on
```

the network. The reason is that I am hoping that I could
send my messages to that person and that later on
they could deliver it. I am trying I guess to be innovative
a little(well maybe not) in doing this. Hopefully this person or
persons will be closer to Saudi Arabia than I am now when I
send a MARS message.

Is there anybody out there?

Thank-You

Dan Gibson

> That depends on what you call efficient.

If efficiency is measured in dollars and cents, I submit the following quote:

"[CW is] 50 cents a word while SITOR is around $2.40 a minute."
Aldon Cook, assistant to the Senior Electronics Researcher at Woods Hole Oceanographic Institute, quoted in the November, 1990 issue of Monitoring Times on page 8.

> CW is SLOW. Machine generated and machine decoded CW can do a marvelous
> job of efficiency, but that is limited to machines only (and certainly
> does not apply to testing the carbon-based units). The Morse

A factor that appears to be routinely ignored by those who want to compare CW with RTTY efficiency or reliability.

> But that which makes CW impressive does not apply to test
> PEOPLE's skills.

Right on!

My position? CW is OK for the people who enjoy it. I don't think it's a valid entry test for ham radio any more.

Not really. The point of the argument seemed to be that the only modes worth considering from the standpoint of a Morse code test were voice and CW. There are other modes which, taken together, could rival those modes in popularity. Most of them are available in other countries and so could be used for international communications.

In article <535@chiton.ucsd.edu> rec@chiton (Richard Currier) writes:
>By not requiring it you are denying the necessary exposure to it that will
>allow new OPs to make their own decision. CW is HARD. Human nature being what
>it is, sometimes it is necessary to require something unpleasant to get beyond
>the early learning curve. The number of hams I know personally who tell me
>that they are glad that they were exposed to CW far outweigh those who think the
>experience was bogus.

So is working with high-speed packet (> 32kbit/sec), yet it isn't required for a license. It is fun as well. There are sooo many things I enjoy with ham-radio every day, and after 10 years, I have yet to find the first opportunity where not knowing morris is a big loss.

Don't force others in your very narrowed view of ham-radio: HR has much more to offer, and many code-less hams in other countries prove that every day.

>Now here's something you can flame me for...I think the no-code attitude is
>selfish and arrogant. You want to change ham radio in ways that I think will
>destroy it.

How is it that I keep on hearing very worried stories about the average age of a US ham? How come, that I don't hear similar stories from other countries?
Other countries which have code-less licenses for may years have proven that

it is a Good Idea. Or at least, it's not as destructive as you say it is.

>   You may have the best of intentions, but I don't think you know
>and understand what has kept the hobby alive for the past fifty years. The
>deterioration of good operating procedures we all now hear on the bands is a
>direct result of the loss of the sense of fraternity and tradition that I still
>hear on CW.

The thing that kept the hobby alive wasn't forcing people to learn morse code,
but common interest into playing with radio and meeting friends with similar
interests. Back when everybody made contact using 0V1's, morse was very
important. Right now, there are other possibilities.
Morse is still enjoyable, but so are other modes. Let there be room for all.
Let people find out for themselves if they want to go into the very specific
mode you enjoy working. It is one of the archievements of ham radio that
we now have this choice.

>   So what conclusions can I draw? I work VHF,UHF,digital and HF SSB
>and I'm appalled by what I hear. How can I not associate an anti CW thrust with
>a knife in the heart of the Amateur Radio Service? I hope I'm wrong. I hope
>I'm just paranoid. But why do I keep spinning the dial down the bands to talk
>with people who make me feel good about what I'm doing instead of feeling
>profoundly embarrased?

You'll find those people everywhere. In fact, in my neighbourhood, most of
the people you described have a code-full license. They started code-less,
later added the code test.
On the other hand, most of the people I enjoy working with still have a
code-less license. They found other interesting modes and are now occupied
and don't want to not have time to learn morse code.
This is a bit extreme, but I hope it convinces that morse code tests and
bad manners don't neccessary are coupled.

>   AA6PN

[You should check your news software. The return address you give is likely
not to work. Shouldn't that be included in the ham radio exams nowadays :-)?]

Whenever I see "IMHO", I can usually be sure that humbleness has nothing to do with it.

Also "IMO" means IN MY OPINION. No humbleness intended.

For a while I thought it must mean IT'S MY HORRIBLE OBSERVATION.

Anyway, if you edit it out of all communication, it still reads the same.

>Really Paul. Who told you that you MUST learn Morse. Apparently you
>wanted the ham ticket, so YOU told yourself that YOU wanted to learn the
>code. I don't see any one FORCING any body else to learn Morse. Get
>real.

Part 97 clearly states that "the applicant must demonstrate a proficiency in Morse Code." Clearly, in order to obtain a license, I am forced to learn it. The implication which you're attempting to make is that "nobody forced me to obtain a license, so therefore nobody forced me to learn morse code", is a bad syllogism.

>Assuming that you are in college (From your usenet address) or work
>there, I can just imagine that you are only taking classes (or have taken
>them) that you will use in the future eh?

As a matter of fact, 1) I happen to be a student, and 2) I am taking some classes at the moment. I lay claim to the fact that I've never complained about having taken a "useless" class in my nine year (so far) academic career, simply because I consider everything I've taken to be of utility. In contrast, Morse Code does not meet this test; it is 1) a manual skill and not an academic pursuit, 2) a skill of questionable utility, a judgement that I have not made lightly -- you will recall that up until two years ago I did not support no-code.

The fallacy here is to assume that all pursuits have equal qualitative merit. For example, do you assume that learning to wash a floor and learning to design an amplifier have equal merit?

}fields. Hooking more people on a technical hobby is instrumental in steering
}them to a technical career. Saddling potential recruits with a requirement to
}learn a mechanical skill most of them consider mere hazing is counterproductive
}to these goals.

What makes you think dropping the code requirement will result in
explosive growth in amateur radio? I highly doubt we'll get the
annual growth rate up to even 5-7% with no-code.

Let's face it, ham radio just isn't the cutting-edge hobby it once was,
not with competition from computers, video games, etc. (none of which
require a license of any kind).

Henry Black (G4NOC,KK6JR) inquired;

>Please could you post a brief summary of what this has cost you in
>time and money so far.
>Is there a fighting fund?, is it adequately funded?, am I right in
>thinking you are not using any "special circumstances" to win your case
>and therefore your fight stands to benefit U.S. hams generally?

At last count it was about $6,500 on the day BEFORE the depositions
and that added another $1,500 ++. I still owe some of it but Bob (W2THU,
League consul) has been very gracious about waiting for it. All but a
hundred or so has been out of our pockets (WD8EHL--XYL).

We have been at this for 4 years as of yesterday. Three in federal court.

There are a few volunteer trustees waiting to open the fighting fund
if we don't recover expenses. We hope to find out any day now.
We will let you know via QST and ARRL letter etc.

There are no special circumstances in this case.
The city has an ordinance allowing towers up to
--- SIXTY FEET ---
I checked that out before we bought the place.
What they didn't tell us was that the neighbors
had the last word on the permit.

The permit was denied because;

a) it would impact property values of the entire
community regardless of its height.
(30 ft. at a 29.1 ft. setback)

b) I didn't need it to develop   my property.
(Never mind the other dishes, towers
and beam antennas in town - 6 or so , some non-hams)

We do this for all of Ham Radio. All for one and one for all.

Your first clue, is that since you have two energy storage devices, that
you should have two poles. When I solve this, I get:

```
                     c1r1 * s + 1
H(s) = ---------------------------------------------
       c1c2r1r2 * s^2 + (c2r2 + c1r1 + c2r1) * s + 1
```

It tends to be quite lossy as a counterpoise for verticals.

> I can probably bury a limited amount of wire, but not nearly the length
> required for 20-40m radials.

If you do bury wire, use the insulated type. The idea is to create a ground image that is not very lossy, not making electrical contact with the soil.

>
>
> Basically, would I be better off mounting the vertical on the ground rather
> than adding, say, 10-20' of elevation?

You would be best off getting the vertical up in the air, with sloping radials.

>
> How well will ground mounting work to eliminate the need for radials?

Not very well. But just about anything will "work" as an antenna.

Hey, Gang:

Can we try a "Gedankenexperiment"?

I recently attended a seminar on "Needs Assessment" conducted here at TI by Dr. Allison Rossett (Allison Rossett and Associates, San Diego, California) in which we discussed something she calls "OPTIMALS", the attributes that are desired, or the ideals of what we think should be.

I would like to compile a list of OPTIMALS describing Amateur Radio, and so I turn to you, the net participants for inputs. All you posters and writers and flamers and thinkers and dreamers and even those read this all but never post anything. Please think about this for a moment or two and send me what you think should be on the list.

Use your imagination. Close your eyes, sit back, take a breath, and describe for me the HAM OF THE FUTURE. Forget what the Amateur Radio Service is today. Forget Part 97 as it stands now. Totally ignore the current Question Pool and VE program and Examination Elements.

Don't start with what we have today, but project yourself forward to the end of the Nineties and describe for me the attributes of the (*-IDEAL-*) Ham Of The Future.

What does this person know? What skills and attitudes would such an individual have? Pretend you can, in your dreams, make Amateur Radio in the Twenty First Century what you would like it to be.

How should the public and the government view the Amateur Radio Service? What value does it provide, or in essence, WHY does Amateur Radio exist in the year 2001?

I am not trying to be facetious, and although I don't mind a ":-)" or two, that is NOT what I am looking for, and they will not be included in the database.

I would like to know what folks out there in netland HONESTLY think Amateur

Radio (*-SHOULD BE-*). No restrictions based on what is current fact.

Tell me what you want.

Please email directly or post. I might ask for clarification since I am
trying to isolate attribute elements, descriptors, and points that (*-can-*)
be summarized.

Regards,

Bob West WA8YCD

Congratulations to everybody who had these amazing scores, including N5AU, N2RM, KR0Y, and, of course, K1AR. Jeeze what a score. A tremendous effort by the operators, an excellent station, and maybe the ultimate example of the effect of packet radio on multiop contesting. Do you realize that K1AR, as a multi-single, claimed more countries than W3LPL? !!! (708 I think it was they said on 3830 [in between that guy saying "hey George"])

I was single-op at N4WW, but unfortunately had technical difficulties. Until Saturday night I was putting out maybe 600 watts PEP (I think with lousy audio to boot). Needless to say, I had particular trouble on 160, 80 and 20.

Conditions were so good, though, that I had fun anyway. I managed to climb back up to about 3.5M by the end.

How many of you checked 15 in the middle of the night? Maybe it was only down here in the Southeast, but I found 15 WIDE open to all of europe at 0830Z Saturday morning. I worked about 120 stations before it sort of shut back down. The europeans were pretty suprised to hear me, and I was especially suprised and pleased to be called by VU2GO at 0900. Beat the hell out of looking for South Americans on 75. Last year in the CQWW CW 15 opened to europe after midnight (in fact you could follow their sunrise across UA-SP-DL, etc., but the signals were fairly weak.

> N5AU broke the old USA multi-multi record and beat the group that has been winning these things lately (W3LPL). We had something like 6600 QSOs, 190 zones and 700 countries for 17.2M or so. Unfortunately for us, YAECO (Yet Another East Coast Operation) from W2-land was a little more successful and finished on top. *Sigh.*

I just want to congratulate N5AU on a fine second place finish in multi-multi. The team down there has worked long and hard building towers and some impressive antenna hardware....way to go! Obviously the operator crew had a lot to do with the success. :-)

I've helped build and operate both the top finishing station (N2RM) and the third place station (W3LPL). Both of these stations have impressive antenna arrays but antennas alone don't win contests....operators and the way they work together are what's really important. I've participated in some not so successful multi-ops and some *very* successful multi-ops......it's all in the operator chemistry.....

This past weekend I had the pleasure of operating with Ken K1EA, John K1AR, Steve N2IC, and Dean N6BV in a multi-single effort at K1EA's house.....we broke the old multi-single record (6.9M) with a score of about 11.22M. As I page through the log all I keep seeing is passed multipliers....that was one of the big keys to our success....we'd work a station on one band and pass to another band right away or as soon as that station could get to the other band....CT is indispensible for knowing who to pass and where. The other key to our success was the ability to run high QSO rates and to hear the weak ones using stacked yagis on 20 through 10 meters.

We all agree that the '90 WW SSB Contest was one of the highlights of our operating careers!

I think that it would be much more valuable if every ham were forced to pass a CPR exam instead of a CW exam in order to get his license. CPR is certainly of greater potential value to the public than CW ever will be, and it's just as relevant to technical development. More relevant, if you're working with high voltages.

Oh, you don't think CPR is valuable, eh? Then stop pounding that old "Service to the Public" drum.

Not that you couldn't learn both, of course. But if I had to pick between the two as a licensing requirement, CW would lose.

Keep the dipsticks out, too. At least as much as CW has. :-)

Hmmm... I can't figure out how to choose vi as my editor, and I have no foggy clue how to really use Emacs, so I can't edit the above down any. I promise I'll figure it out before I post any more.

Any way, its nice to see so much discussion of the contest, seems there are quit a number of fairly serious contesters on the net - we need more discussions of a number of contesting-related topics (after I learn how to edit better!).

As for PJ9W and PJ1B, I think Dave is right on the money, but there is another factor directly related to the hardware which may have had a much greater impact than you might believe. When we set the record at P40V and beat PJ1B that year, their antenna system looked much superior to ours on paper, yet ours worked much better. The P40V system consisted of 4 over 4 on the high bands, at no more than I think about 70', while PJ1B had much taller towers. The difference was that on the high bands we had our stacks split. Our top antennas were rotatable, but the lower antennas were fixed on about the W7/W0 boundary. Virtually the whole contest the top antennas were pointed at Europe, and we fed both top and bottom in phase (in fact we didn't even have the capability to switch to just top or just bottom). The antennas had also been tweaked to have maximum forward gain and virtually no front/back.

What we had, in effect, was gain equivalent to maybe a good 3 element beam all the way from the west coast to southern europe, and the equivalent of a dipole off the back.

On the other hand, that year at PJ1B they didn't split their stacks, so they had to point at either North America or Europe, losing a lot of contacts from the other in the process. I don't know for sure, but I'd bet money that PJ1B learned the lesson that its better to be very loud in a lot of places than to be extremely loud in one place at a time. The high band arrays at PJ9W were awesome, and would have kicked serious butt from the U.S., but I don't think they had the optimum setup for PJ9. (Also, was it just me, or did everyone think PJ9W was really blowing it on 160 - it didn't seem to me that they had put any work into receiving antennas on that band)

All the credit for the '88 P40V antenna system design goes to Tom, N6BT.

By the way, P40V was single-op this year. Carl no longer has access to the old location, and apparently his new one was tenuous enough that he couldn't make any multiop plans.

I'd call this an open machine with LID filtering. :-)
It doesn't seem practical as a chat machine what with all the individualized codes required to key it. It would be a practical way to control patch access though. As you probably know, I'm not keen on non-emergency autopatch.
I got my new 440 machine on the air from it's final location today. How sweet it is! It's an open machine running 18 watts at 970 feet up a 1040 foot broadcast tower. The view from up there is spectacular.

Thos who chose the nocode license did so because they didn't want to learn
the code (yet) and so are unlikely to want to use it either. But even still
it is not necessary to prohibit it altogether. They can still use Morse
Code in modes such as CW and modulated audio. It would be bad operating
practice for them to jump on the WSDX subbands to learn on.

>   If the guvviment gives you a code privilege, it should test you on it

If the guvviment gives you a voice privilege, it should test you on it
to make sure you have rudimentary ability to use it.

It might be the current attitute that the theory tests have a basis in
preventing the destruction and suffering of innocent electrical parts at
the hands of dumb hams, but this is not really the case, and just is not
a valid reason for the theory test. I suspect your statement might be
made in order to later try to justify the removal of the theory test.

The purpose of a theory test is to make sure you understand how radio
itself works. You need to know some things about how radios themselves,
particularly transmitters and antennas, work. But you do NOT need to know
how to actually build one to be able to use one. So it is not necessary
for at least the lesser license (read: it is not necessary to get INTO ham
radio) to be able to do this.

And besides, you'd be depriving someone of the pleasures and joy of
watching and smelling resistors burn up. :-)

>WARNING WARNING Facetious paragraph follows...

Oh, I thought your PREVIOUS one was facetious.

>   Aha. Many hams don't build their own radios. Let's create a
>non-technical license, in the ham bands, for people who buy everything
>off the shelf. Allow no technical changes or construction. Just plug it
>in and Yak Yak Yak.

>END OF FACETIOUS PARAGRAPH.

Glad you acknowledge that the paragraph was facetious. But of course even
with a turnkey radio, it is still really necessary to know a lot about the
principles of radio to know what is going on. So far I have seen NO RADIO
on the market that can prevent RFI, for instance. The operator still has
to know what the radio is doing.

>> If anyone wants to learn it, fine, but I still haven't seen any LOGICAL
>> reason for making everyone do it.

>airwaves. If you think 5 wpm is slow, what do you think 1 wpm would sound
>like?

1 WPM? Are you kidding. Don't even suggest learning that way.

>   2. The international treaties governing radio demand it for activity
>below 30 MHz. As all current ham licenses have privileges below 30 MHz,
>it is required for all current ham licenses.

Fine. This is a case for continuing the requirement below 30 MHz, but
lots of people don't care about those bands (but they aren't hams yet
due to the code requirement).

>   If you want to create a special no-code license, these reasons are not
>relevant. However, as you seem to want just to eliminate it from the test
>without prohibiting its use, they are both logical and valid.

No other privileges have specific tests to grant their mere use, so why
should code?

I am a "no-coder" but am already a ham. I wasted my 6 hours learning 5 WPM
so here I am, "one of you".

I suspect you were really referring to the people who are refusing to get
into ham radio because of the code test. They spend just a few seconds on
their "whining". Show me someone who can learn 50wpm in the same time?

I see your smiley. I took it as the joke you intended.

Several of the top European minds active in packet radio development entered via their homelands' versions of no-code. I would name names, but I don't remember them. Someone else will no doubt jump in here and fill the gap.

>I think you are wrong. The deterioration of good manners among younger people
>is a reflection of society in general that has nothing to do with CW.

Yes Yes Yes....This really is the crux of the whole problem. CW itself does not make for better hams. However, the discipline of learning to operate CW used to require a lot of air time. All of this operating time served to teach new hams proper operating procedures and instill in them a respect for what used to be the fundamental traditions of the Amateur Radio Service: civility,friendlines, patience, and a sense of community dedicated to public service. Today, CW is learned from tapes, computers etc. and very little operating is being done by new hams. What the more traditional (OF) hams are afraid of is the loss of the traditional values. They believe that without the glue of tradition, the Service will collapse into the anarchy of CB. I think this is already happening.
>
>One of the reasons that the operators in the CW subbands are marginally
>more mannerly is that many of them are older and were raised in a more
>mannerly society.

Another three yes's... Most of the hams in the CW bands have spent a long time there learning to operate. The newer hams there seem to be attracted by the the traditional feel of operating there and are willing spend the time and overcome the obstacles necessary be at home there. It's the attraction of being able to go back in time and live in a world that was friendly, mannerly. I have lived in the 40's and 50's and I will tell you outright the life young people today have to look forward to sucks. I feel sorry for them and for myself that I have to watch it happen. Thats why you will find so many traditional hams trying to preserve in ham radio what society today has lost. A decent place to live. And pass it on to young people because they deserve better.

Above 30 Mhz, I agree. Nobody knows what will happen above HF when a no-code licence is implemented. Maybe good things, maybe nothing, and maybe chaos. I hope for the best.

Below 30 Mhz, if the Amateur Radio Service does not reverse the decent into in your face street behavior, commercial interests will have all the ammunition they need to justify seizing all of the ham spectrum as being too valuable to waste on a bunch of radio hoodlums.

Remember: "When they take away your rigs..."
          "Only the bootleggers will have rigs."

>What makes you think dropping the code requirement will result in
>explosive growth in amateur radio? I highly doubt we'll get the
>annual growth rate up to even 5-7% with no-code.

It won't. But what exactly happens will depend on the exact licensing structure.

What really burns me up, though, is attitudes like "OK, we'll accept a no-code license as long as it is just an entry point, and there are incentives to learn CW and upgrade to a REAL license". These people are going to cause there to be a license class that NO ONE will like.

But back to ham growth:

By itself, a codefree license class is not going to cause people to come knocking on our door. We have to invite them over first. It will be a lot easier to promote ham radio once there is a codefree license class that has enough privileges to be useful.

But we still have to get out there and promote it. We've had MANY MANY years of code being required for ALL license classes, and as many years to promote ham radio. Now where are we today? We are losing spectrum and our kids are playing TMNT video games instead of learning how something actually works.

By requiring code to get into ham radio, we are depriving our kids of a opportunity to experience an aspect of technology that will be in high use in the future.

>Let's face it, ham radio just isn't the cutting-edge hobby it once was,
>not with competition from computers, video games, etc. (none of which
>require a license of any kind).

Are you wanting to just let it go at that and give up on our kids?

It's obvious what we should do. Clearly we should get rid of the CW test because it's too hard for some people and many people are sure they will never use it. Same goes for voice and other other modes, building equipment, knowing about propagation, being a VE, operating from space - obviously we have to eliminate all those topics from the ham tests.

Still, some old-fashioned people think we need *something* to make the license worthwile, so I propose three classes as follows:

Novice - knows own name

General - can print own name

Extra - can write own name in joined-up writing

This may be too hard for some, and they may indeed never need to write their own name so perhaps it's too restrictive. Maybe we should just revert to the good old Amurrican system and sell the licenses. More money gets you more privileges, just like the Real World.

The continuation of the CW requirement won't correct a situation that is
just getting worse. Here's ONE observation of why things are pretty bad,
and why a lot of it is on the HF bands. DX used to be a fun challenge.
Today it is no longer so much fun. It appears to be, but the HF bands
are overcrowded (would be nice if they QSY to microwaves) making pileups
the order of the day for every rare DX. Top that off with the fact that
we pretty much know all there is to know about HF propogation and the
challenge is gone.

The past is the past. It's nice to go back, but you have to have something
to go back with. But to preserve ham radio you have to deal with the world
as it is today. Maybe you just are not prepared for that.

But preserving a way to dream about the past is not the goal of ham radio.
If you want it to be, petition the FCC to change the Basis and Purpose.

The past is useful for knowledge, but *I* look towards the future. If it
looks bleak I will try to change things so it won't be so bad. But I won't
crawl into a hole and just dream of how it once was.

>Above 30 Mhz, I agree. Nobody knows what will happen above HF when a no-code

I at least did a bit more than hope by filing comments to suggest ways to
make sure of the success.

Us VHF/UHF'ers will work on our segment if you HF'ers work on yours.
Deal?

It may be still a few more months before the FCC makes a decision on
90-55, the Communicator/No-Code issue. Between now and then, I'd like
to see some hams do something worthwhile to help correct the problems.
Specifically I suggest that each and every one of you, whose PRIMARY
bands of usage (however you want to quantify "primary") is HF, take it

upon themselves to actively promote the UHF and SHF bands to other hams whose PRIMARY band of is HF.

Set as your goal to convert ONE HF'er per month to be a ham whose PRIMARY band of usage is 220, UHF, or SHF. Upon conversion of 10 such hams, maybe we can award you with an "Honorary UHF'er" award.

You will be doing all of Amateur Radio a big favor in TWO ways.

1. You will be helping to increase the (badly needed) usage patterns of the UHF and SHF bands.

2. You will be helping to relieve the overcrowding situation on the HF bands.

If hams had been doing this for the past 10 years, there probably would not have been this silly code debate.

This is assuming, of course, that whomever the manufacturer that is sending you the RS232 signals actually followed the standard. There seem to be a distressing number of companies that just omitted the negative going voltage and ran semi-ttl with say zero v. for mark and +5 to +10 for space. As I tell my class, your chances of having two devices talk to each other which are "rs232 standard" are about 50%. RS232 is about the most non standard "standard" you are ever likely to run into.

I have to admit that things are better now than a few years ago, since chips like the MAX232 have come onto the scene...

I have a 286 computer with 2 Meg of "extended" (on-the-motherboard) memory. K1EA's CT program uses "expanded" (on-an-external-card-plugged-into-a-slot) memory (when found) to increase the amount of QSO memory available to the program.

I have been using two software "emulators" with great success to create "expanded" from "extended" memory. PC Magazine's EMS40 utility and ABOVE DISC+ have worked successfully with Quattro Pro and Lotus; neither will work with CT. With CT, I get random results (like the logging window goes blank and won't display QSO's for a new log, or if I reload a log with 1 QSO it displays properly until it crashes sometime later, or if I reload a large log CT gives me an out-of-memory error and crashes after about 300 QSO's). :-(

I'm curious if anyone else has tried to use "extended" as "expanded" memory on a 286, and if you got it to work with CT? Or will I need to pull that memory off the motherboard and put it on a cheap EMS card (yuck)? I will be upgrading to a 386 with 4 Meg of on-board memory- will I have a memory problem again?

Thanks, Dwaine

I appreciate all of the replies I got on asking for the schematics for a HAMMARLUN HQ-129-X receiver. A special thanks to Jim Haynes in Felton, CA for sending me out a copy of the manual so quickly.

I stand (sit actually) corrected about this radio being a transmitter - it is only a receiver. I had assumed since there was a knob on the front saying TRANS/REC that the transmitter was built into the radio - this isn't the case. Anyway, about what year was this radio made? And, I have a terrible audio hum, will replacing the capacitors most likely solve this problem?

For you tree climbers out there I found a webbing version of a tree climber in one of my hunting catalogs. It has a webbing harness and a webbing climbing loop.

Advantages over rocks, arrows, etc are accurate, exact placement of antennas, no hangups, no kiddies with arrows in their backs.

Advantages over tree climbing spikes, metal hunting climbing stands, are cost, and zero tree damage - both very important. An extra climbing loop allows safe climbing around branches.

Stands and spikes (w harness) can easily run $150 or more. This runs around $40 to $50 which is in the affordable range. Just what I've been looking for! (If I could just get the top of that loop up another 30 ft or so...)

If anybody is interested I'll dig up the info on this.

73's,

I think the code/no-code war is a moot point. What we *need* is *much* greater use of the UHF and microwave allocations. I really don't think a no-code license is going to make that big a difference. I submit that the "typical" no-code licensee is going to be more interested in plug-&-play technology, and having someone else to talk to.

There is precious little equipment available commercially for microwave (> 1.2 GHz). There are *damn* few people operating > 1.2 GHz, therefore few folks to talk to (outside of metropolitan areas there is virtually *no one* to work). I fear that the allocations at 2.3, 3.4, and 5.7 GHz are going to go away real soon. If we want people to occupy these bands, we need two things:

1. Commercially available, plug-&-play equipment.

2. A *reason* to operate on these bands.

Sure, microwave experimentation is fine. So is weak signal work. The sad fact is that this is pretty much all that is going on at 3.4GHz and higher. Now, a national network of microwave packet switches would help, but this is most likely not going to be implemented outside of metropolitan areas any time soon. Geosynchronous orbit satelites would help, but they seem to be a ways off, too. Digital multi-media communications would help, but again, it ain't here now.

Where we are now with the microwave bands now is pretty much where we were in the '20s with 5 meters. Along came full duplex AM phone, and the band took off like wildfire. We need to spark the imagination of the AVERAGE ham about our microwave bands. We have to do it now, in 10 years we won't have to worry about it because they will be GONE!!!

Yes.. there are several active groups... first, a magazine called Electric Radio out of Hesperus Colorado is a really nice magazine that is focused on 40-50-60s tube equipment, and there are restoration and upgrade hints, as well as lots of ads for vintage stuff. This publication is strictly ham-oriented.

also, Antique Radio Classified... which has *lots* of ads, but is slanted more toward broadcast receivers and "antique" stuff. Both are very nice, but aimed at different audiences (tho they obviously overlap at times).

I'll post the addresses for both when I get home tonight.

[Lots of stuff deleted about CODE-NOCODE, paranioa, knives in hearts, and eating veggies you dont like]

The following is an opinion. Like the law, truths are irrelevant, only perception and sales drive the outcome.

First some facts:

- I am a new ham (only licensed for 5 months)
- I like CW better than all other modes
- On many occasions, I have used other modes. I use packet everyday. I sometimes use RTTY and AMTOR when I want a change.
- SSB is my second favorite of all modes.
- I enjoy DXing and the challenge it presents
- I like contesting too... but need much more practice before I will submit a log.
- I also enjoy a good ragchew.

Now some opinions:

- I think HAM Radio should be made more accessible to the masses. I think radio is viewed as an "archaic" technology by most-- a "solved" problem. Most young people would rather learn to program computers. You can make more money at computers than HAM radio.
- We need more young people in HAM radio.
- We should not allow HAM radio to become undisciplined.
- We should not force people to learn a particular mode to become a HAM.
- We should continue to encourage experimentation and technical excellence in HAM radio.
- We should continue to find ways in HAM radio to allow participants to grow, attain new goals, and make accomplishments. We should be sure that people have something to work for and feel good about when they get it.
- These goals should be difficult, but not out of reach of MOST people -- and relevant to the hobby of HAM radio.
- FINALLY, we should not assume the average HAM is lazy or below average in intelligence. So we should not make these goals too easy to attain.

I have heard all of these arguments through reading 9 months of discussion on the code/no code issue. I believe they all have merit. I do not believe any one of them precludes or necessitates the inclusion of a CW test to obtain a license to operate HAM radios.

The one thing I do feel strongly of is that we should find ways to assure our bands remain disciplined and that we provide goals for our fellow hobbyists. However, I currently have no data to support the argument that test format or the CURRENT incentive licensing system achieves those goals.

I do believe incentives are good, though. When you work hard for something and attain it, you achieve a greater level of self respect, and you are inclined to be active in protecting the rights you worked for.

My General class ticket expired many moons ago (around 1970 or so). I assume that I have to start over and take the code and theory examinations to get my license. (I think that I can still remember code but probably not at much better than 5wpm). I use to be active on 15 and 20 m but would now like to play around with packet radio. What class of license would make sense (used to be Technician) today and is Kaufman's Q&A still the text to study? I don`t suppose there is anyway way to get one's old call sign back (WB2CLL), is there? I imagine it is in use by some chap. Can one request particular call signs (old or new)? Used to be that Amateur Extra class could get old call signs. Of course, this is more for nostalgia thatn any practical need. Thanks very much.

Hi everyone, I'm not sure if this is the place to post this or not, but it seemed relavant at the time. I recently got involved with TCP/IP on packet radio. Using a modified version of Phil Karn's Net.exe (G1EMM I beleive) and I was wondering if there is any type of manual available for this version. I have the original version that came with NET.EXE (dated January 1987, I think). This has been very helpful, but there are a lot of questions that are still unanswered. Any help with this would be greatly appreciated. Second question concerning TCP/IP: Can anyone point me in the right direction as to getting an addresss. I sent Brian Kantor a message but have not heard anything from him.
Is he still in charge of this, and if not, could someone point me in the right direction?   Once again, thanks for any help you can provide me.

2nd ever attempt at posting - anything could happen - apologies in advance!

My UK licence spells out very clearly that certain HF bands are shared and that we use them only on a secondary basis. Some of the primary users are shore stations and some were/are only equipped to transmit CW. These users have the right to ask amateurs to close down. If the rule-makers were not satisfied that amateurs could be relied upon to understand a request to QRT in CW at a speed that a commercial op could go down to, then we probably would have fewer HF/MF bands. It is likely that CW was seen as a sort of simplest common denominator with (at that time) the best chance of getting through so even phone and RTTY stations might have to resort to it !

As RF tends to be rather non-patriotic regarding immigration control,even countries without secondary-status amateur bands have a CW requirement to help those who do.

I believe that there is an international agreement insistint on proof of CW ability (no particular speed, though) for access to <30MHz amateur bands.

Marine radio is dropping the use of CW, and is also using satellites increasingly. It is possible that if the legislators can agree, and that if secondary user bands remain then some "universal" mode to substitute for CW can be agreed upon, then CW can become an optional skill

I think that it is fair to say that the CW requirement was a reasonable thing when it was imposed, and the reasons (as seen by legislators) are only just now going away, but no-code licences will be possible.

The UK does not have incentive licencing , so we probably have a different viewpoint to those of you in the US, But we do have no-code amateurs on all >30 MHz bands, all modes, full power. This enables one with no interest in HF to choose to ignore CW. To go on HF requires a CW test pass to comply with, I believe, internationally agreed requirements. Many of our no-code people are good operators although some are bad. Of those who passed the CW test, exactly the same can be said.

I find CW fun

I hope people will voluntarily try it

I hope they enjoy it

I just dont see any advantage to amateur radio in forcing it down other people's throats.

I think that it is ill-mannered to try to FORCE your values on others

  I think I'd better find a flame-proof suit

   73
  David, GM4ZNX   (yes, an HF callsign :-)

A while back I posted to this news group and recieved good results. However, I still have not found a morse code trainer. I have recieved from some hams at Sun a wonderful morse generating program. Type what you want to hear and end with a carriage return. It is called 'send'. The tones that are produced are pleasing to the ear. However, this is NOT a morse trainer. Does anybody have some C source code for a morse trainer? Especially one that could be grafted together with 'send'. BTW, 'send' supports the farnsworth method :-) Also, 'send' is for /dev/audio on the sparc1+, so keep that in mind if think you would want it for your machine.

On September 21, 1990 the federal court in Cleveland Ohio filed an order which gave me a battle victory (war not over) in my quest for a permit to put up a Mosley TA33M tribander at my QTH in ROCKY RIVER, OHIO.

The judge declared that the "government's strong interest in amateur communications" was not considered in denying my permit and therefore the ordinance cited was prempted by PRB-1.

The ARRL has a copy of the order and there will be a note in the December QST.

We have been at this for four years and it isn't over, but at this time, it appears close.

I have the text of the order scanned and on disk but am not sure if this is the place to post a 30K file.

We are in the 6th circuit, federal courts.

We have no CCRs or ordinances prohibiting antennas, there are about 6 towers and tribanders in this city of 21,000 and it is just a case of the neighbors having more pull at city hall than the federal law.

During the CQWW, we used it at N2RM. I might mention that N2RM set the US record and won in the US if our final tally holds up under close scrutiny. K1EA was an absolutely indespensible part of the effort. We had 9 stations going. Each BAND had K1EA running and `networked' to all the others <AND> to a PACKET cluster. The PACKET cluster call outs are displayed live during the contest and made a significant difference in our getting 40 zones on multiple bands and I personally credit not only operator skill at N2RM, excellent equipment, but also the efficiencies afforded by K1EA. Logging is a breeze and DUPES need never be entered. If you here a callsign and many are calling and you wish to know if it would be valuable to hang around long enough to get the station, K1EA will tell you whether or not this station is needed on the band you are operating. If you are networked, it will yell at you if a station is called out on the packet cluster and inform you the station just called out is needed AND on what bands. I credit this with 10% of ALL N2RM's multipliers.

N2RM's tally was 18.2 million.

I have no connection with K1EA and used it for the first time during the CQWW. It is worth every cent you pay for it during this kind of effort and I am sure it would be even more valuable to a single op unassissted in keeping records straight.

We worked over 2000 on both 20 and 15 and 1950 on 10 meters and set a new US record at N2RM if our score holds up under close scrutiny. It was one of my better ham operating experiences. Frankly it came close to the joy of having satellites that I participated in building successfully launched. It was a great weekend from 160 - 10 meters.

Bob

I tend to use "Y'all" which I got from my Georgian aunt.  Being from
Southern California, I sometimes mix "y'all" with "radical",
"tubular", and other regional phrases.

     "Like, oh my gawd, y'all!"

I also teach.  While this phrasing sometimes leads to chuckles (and
smirks from English aficionados), I've yet to be accused of being
sexist or gender restrictive.

     "Y'all have to be careful with your power supply bypassing
     when you combine 555 timers with other circuit elements
     because the 555 uses a big slug of current when it switches."

Personally, I'm not wild about putting a live soldering iron inside of a "hot" radio, especially one supposedly filled with CMOS. If I remember correctly, the RAM/battery combination is on a plug-in board, so it can probably be removed and put on the bench for the battery swap. Then all you need is a low current supply to keep the memory alive while you do the battery transplant. I'll take another look in the service manual when I get home tonight to see if there is anything I missed. It really makes you wonder about what went through the radio designer's head; I can see putting the memories in battery backed-up RAM, but not the code for the micro-controller. Thank goodness I still have my Drake twins in case my soldering iron slips :-).

(Richard A Hyde at rah@btr.com writes...)
When I took my code test two months ago (and STILL no certificate!), the VEs DID use a multiple choice test for those who failed to copy one solid minute.   In fact, the pre-test instructions included hints like: "listen for key phrases such as "My name is..." We were then supposed to listen very hard for the next letter. If the next letter was, say, M

and the multiple choices for the senders name were Martha, Jim, Sam, and Tracy.... well, you can see how it goes....

(Don Perley - KE2TP - writes...)
That is sure different from the test I took last summer. The instructions were emphatic that your fill-in-the-blank answer had to be exactly as sent, or be marked wrong. As an example, if the senders QTH was sent as "paramus, nj" and you wrote "paramus, new jersey", or "paramus, n.j." it would be marked wrong.

In addition, the test leaned towards questions that you couldn't answer from context if you had missed a key character, like "how high was the sender's tower?" (something like 179 feet) or some third parties call sign that was mentioned.
...
====================

My experience with the 13 WPM test a couple of years ago matches what KE2TP saw -- fill in the blank... exactly as sent. (Laurel VEC)

However, I actually took that test before I was really up to a solid 13 WPM -- but I passed by the skin of my teeth even with really ratty copy. The phenomenon noted by Rick above was what saved me. The question that put me over the top was: "What kind of pet did he say he had?" My copy (using "*" as a missed character) read something like: "... ***pet *at. " Figuring "cat" as a better bet than "bat" "rat" or any other "*at", I sign myself

-- "Gary" N3FRS, (Amateur Advanced)

P.S. I went home and unplugged my key. I'm not even sure where it is now.

P.P.S. And I *promised* myself I would never add to the code/nocode noise level... oh well.

A while back I posted for info on Satellite T.V. Video Cipher srambling. The following are three of the best mailings I received out of many. A lot of people asked me to post any info I got so here it is:
(Names of posters have been deleted)

(1)

> I have some questions regarding Satellite T.V. and VideoCipher II.

> 1) How come I never see this subject on the net ?

Touchy topic. CAN be but not necessarily illegal. I like reading about it, but I stay away from actually doing the modifications. Kind of like picking locks - interesting, but it can get you into some real trouble if you go around doing it.

> 2) Did any of you read the articles in Electronic Eng Times on DecTec
> and the new SUN decoder (Oct. 22, 1990)? Does anyone have the address
> of DecTec or info on ordering the SUN decoder ?

NO. There is a unit called "Sync-A-Link" which gets the video on VCII services. There is also a complete VCII clone available in Canada - but it would violate too many copyrights to import into this country. Really, as far as I'm concerned, GI has a monopoly here and that shouldn't exist!

> 3) Whats the latest scoop on VCII decoder hacking, anyone got the 032
> type working ?

032 boards work. They're a bit more difficult. They take different software and different seed keys. They can be converted to 010s with a $100 or so module.

> 4) Can anyone explain the following : Wizard Chips, Seed Key archival,
> Auto Updating units, Musketeering, what services the 900 number provides
> and how is a unit modified for the 900 number codes ?

Wizard (keys): These are the decryption codes for the audio stream. They are called Wizards because one set (18 bytes) gets all audio for backyard subscribable services. There is a new one each month. This is the key "cheat" boxes get - actually all boxes get this number. "Cheat" boxes ignore the service mask that accompanies the wizard code.

Seed Key Archival: Seed keys are 28 bytes of keys that come in RAM in a cypher when you buy it. The way the sysem works is this: the vc monitors the data stream looking for it's serial number. When it sees it, it grabs the block of data intended for it. This data are the Wizard codes and channel mask (usually for next month) in encrypted form. The seed keys are used to decrypt this info. The seed keys are kept in RAM which is backed up by a lithium battery. These batteries die in about 4 years and then the vc becomes "brain dead" - it forgets it's seed keys and serial number and no longer can receive the services it is subscribed to. Another use (the reason this was done) is that if you give several boxes the same serial number and seed keys, they will get the same services - so you have a "cheat box". Doing this is called "Muscateering". In addition, most Muscateer software ignores the service enable mask so that the original board only need be subscribed to a cheap service.

Auto Update: By having the appropriate seed keys and serial #, you never have to touch the vc and it will continue to get service.

900#: the one you want is: 1-900-HOT-SHOT. For $3.50, this call will give you one of 3 sets of Wizard keys: 010-019, 032, or F3-18 (a service that you can't subscribe to and thus has a different wizard key)
You won't need to make this call if you have auto updating software. To use these numbers, you need software that allows you to enter them.

> 5) Which of the VCII's have been cracked (ie: 019, 029, 032) and which
> ones have not.

Cracked: 010-019, 032.
The VC+ (029?) has been reported to have been compromised. It is hard to assess yet, because no (or just recenlty) VCII+ services are available.

> 6) What are the best sources for info on this subject, how about
> Telecode ?

Telecode is OK, but I don't think they sell complete software. They do have a lot of info which could probably give you a good background. After all - this is Educational, right?

> 7) How about the Oak system ?

Can be done. It also requires software - but I haven't taken a look at it.

> Any information would be great! Now don't worry, I would never do any
> thing thats illegal. I just want to further my knowlege on how these
> things work. Thanks, Norm.

I had a chance about 6 months ago to take an 010 apart and see how it works. Rather interesting - but REALLY BAD DESIGN. Easily compromised and the VCII serices was built to fail. (Several parts go bad in 3-4 years. Maybe GI wanted to recycle the boards every so often... but it costs the consumer)

Receiving unauthorized programming through a modified Videocipher module is potentially unlawful, thus there is reluctance to discuss any methods in a public forum such as this.

What can be said is that the Videociopher 2000 and 2100 models 018, 019 and 032 have been widely compromised by so-called "chippers". Who alter the units' firmware to simulate authorization of multiple services. The compromise is made possible by an extremely poor and short-sighted design of the DES key manangement by MA/Com, the original designers of the system.

There have been significant changes incorporated in the newer Videocipher Plus which are claimed to prevent chippers from attacking with current stategies. Digicipher, reported to be compatible with HDTV, is in the works.

Yes, there is a 900 number which reads numbers to you in hexadecimal format. There is no explanation of what the numbers are for or what to do with the numbers. I don't think it would be a very smart idea to call that number from your own home unless you want the FBI knocking on your door next month.

There are many sources of so-called Videocipher "repair" software. The best way to find out is to get a copy of a magazine called "Satellite Watch Newsletter" and read the ads (it is virtually 100% ads). It's easy to get taken. I doubt that anybody is going to be stupid enough to go the the postal inspector complaining that he/she was ripped-off buying illegal Videocipher firmare, but only recieved a box of a few scraps of wire and some old TTL chips.

(3)

With respect to your questions, I don't think I can be of much help other than on the subject of the 900 number. I "invested" some $40-50 for something called a super chip, or something like that, and all that came was a $0.50 ic socket, and some nearly useless directions and a data disk that I haven't looked at yet. From what I gather, you must scrape off some of the epoxy from one of the VCII chips and solder the ic socket over it. You then use an eprom programmer to program an eprom to plug into the socket (eprom not included, and no indication of what type eprom to use). Aparently the data on the eprom must be updated once a month via the 900 number. I have not tried this so I have no idea if it works.

Something out there must work, cause they are offering nearly twice the purchase price for old version VCIIs, and the manufacturer is actively trying to get people to trade in the old units.

An interesting source of information is on satellite. I'm not sure, but I think on S1 on Tue or Wed night, ?9 or 10pm est? Some crazy guy tries to sell used sat equipment for 5 times what it would cost at a hamfest or flea market, but he is interesting to listen to, and talks a lot about the VCII situation.

(End)

Well, thats the best information I've received so far.
Does anyone have some more to add to this ?
Remember that fooling around with VCII's to receive scrambled broadcastsiis illegal and you could be fined and or sent to jail for it! But talking aboutit is

not, Norm.

A friend is looking for the power supply to go to an HW101 which he has, but has never used. He would like to buy the supply. Otherwise, if someone had the drawings, he could build one up.

If he can't find anyone willing to sell the supply, he is willing to sell the HW101.

Please email me direct.

An interesting logical syllogism. Hitler didn't invent guns. Therefore Hitler didn't force guns on anyone. The implications are fascinating.

The crime here is forcing a human being to spend time learning a skill that, most likely, he or she will never really use. From a utilitarian standpoint, that's clearly immoral.

The assertion that CW is "efficient" should not be a matter of
opinion; it is a testable statement falling within the domain of
information theory. If knowing that is elitism, then ham radio needs
more of it.

I invite anyone who thinks CW is really spectrum-efficient to give me a
call next time you're in LA. I'll take you over to meet some people
from the JPL Deep Space Network. They're the world gurus of weak signals,
and they do it all with "Belcore (sic) PhD elitist crap".

And before anyone feels the need to point out that the DSN isn't ham
radio, yes, I know it isn't. But CW either is or isn't efficient, and
people who understand the question say it isn't. CW does have the
advantage that it can be decoded by ear by a sizeable group of people.
In other technical respects it's unimpressive.

If you like it, use it and be happy. Don't expect everyone to think
your reasons are compelling.

Actually, if you look back at the various messages on the subject,
nobody has suggested denying morse to anyone, just not requiring it.
It's misunderstandings like this that contribute to the problem.

Are there any good sources on spread spectrum radio transmission technology,
using both direct-sequence and frequency-hopping techniques that could be
applied to data transmission in high noise environments like Local Area
Networks on factory floors?

Looking for books on the topic, magazine or journal articles, or direct
first person knowledge.

Thanks.

Gee, if you can pass the test by copying, say, every _third_ character and playing multiple-choice games, you can pass your General after you attain the lofty speed of.... 5WPM! But you'll have to get to at _least_ 7-8WPM before you can attempt the Extra. Whatever happened to the old "One minute solid copy of random code groups"? (Oh, no! I've dated myself!)

Far be it from me to spread RUMORS (-;  but a friend of a friend has
informed me that the FCC is planning to open a small window to do just
that for a nominal fee. I don't know if its true, when or if it will
happen or anything else about it but if anyone on the net hears anymore
on the subject please post.

>Uhhhhh....didn't Walt retire from CBS a LONG time ago??!?

You are correct that Walter retired from his full-time anchor position
in 1981 or so. However, he is on the CBS board of directors and DOES
have a tremendous say in their operations, ESPECIALLY the news. I
understand he had a LOT to say on the botched firing of Brent
Mussburger. Say, would someone on the net please post the CBS address
for us poor people who don't have easy access to that kind of
information? Also, the address for transcripts would allow us to flame
intelligently....

Sorry, I disagree. Yes, the conditions during the 'test were good. *However*, this whole sunspot peak was not nearly as good as the one in 1979, when Japan was worked in New England on 6 meters (I know, I did it), and Alaska was in for days on end, not to mention the Pacific openings. I've heard that really good sunspot peaks are really 2 cycles apart, so expect to see extraordinary conditions again in 2001.

I have a callbook server accessable via mail. Send your request to
callbook@sat.datapoint.com, and include a single line with the word "help"
for information.

The database I'm using is a over a year old (September 1989), but I will be
updating it in about a month (I hope!).

    No, the most straightforward way to do this is to use a
DYNAMOTOR, which whines and sparks in the dark.

The crime here is denying a human being the opportunity to learn a skill that,
most likely, he or she will use for life. From a utilitarian standpoint,
that's clearly immoral.

Sticking my two cents in here: I have yet to see anyone propose not allowing
the use of CW by those who would care to use it. All I've seen so far are
people arguing for and against requiring people to pass a Morse code test
before being allowed to utilize other techniques on the air.

Have I missed some radical posting(s) urging the banning of CW?

In a previous life I'd like to forget (as WA2TKQ), I worked Australia from Miami Florida with an HW-8 QRP CW rig using an aluminum window sill as an antenna. A friend of mine (N2CR) and I won first place in our category for that contest (which I think was the CQ WW CW contest in 1978). We operated from a dorm room in Pearson Hall, University of Miami. Australia was our only contact. Our category was Multiop QRP with bizarre antennas. Look it up.

By not requiring it you are denying the necessary exposure to it that will allow new OPs to make their own decision. CW is HARD. Human nature being what it is, sometimes it is necessary to require something unpleasant to get beyond the early learning curve. The number of hams I know personally who tell me that they are glad that they were exposed to CW far outweigh those who think the experience was bogus.

Now here's something you can flame me for...I think the no-code attitude is selfish and arrogant. You want to change ham radio in ways that I think will destroy it. You may have the best of intentions, but I don't think you know and understand what has kept the hobby alive for the past fifty years. The deterioration of good operating procedures we all now hear on the bands is a direct result of the loss of the sense of fraternity and tradition that I still hear on CW. So what conclusions can I draw? I work VHF,UHF,digital and HF SSB and I'm appalled by what I hear. How can I not associate an anti CW thrust with a knife in the heart of the Amateur Radio Service? I hope I'm wrong. I hope I'm just paranoid. But why do I keep spinning the dial down the bands to talk with people who make me feel good about what I'm doing instead of feeling profoundly embarrased?

```

I need a modest Public Address system for a nonprofit organization with a modest budget, just something to boost the voice of a quiet president a bit. Budget limit $300 max.

I thought a nice solution might be a boombox with a mike input, and bought on trial a Panasonic RX-DS20 with CD player and tape and FM radio, figuring it could also provide background music for parties etc.
This might work, though I wonder if the 5-inch speakers are up to it.
It seems loud enough but I think I sense a resonance at a few hundred Hertz which might be annoying, and perhaps it won't be loud enough in a room with a hundred people. (price $199)

For a microphone, I thought the ideal would be a wireless mike which broadcasts to the FM radio, and bought (on trial) a Radio Shack 33-1076.
The first one seemed hopelessly distorted, so I exchanged it for a second which is better but still useless. (price $20)

There seem to be a few problems with this approach. The RS mikes seem to
be no-fidelity. (Are there mikes of usable quality which broadcast FM?)
One part of the problem is the Panasonic receiver is digitally tuned,
and it is very very hard to tune the mike accurately. However, transmitting
to an analog-tuned radio also results in awful fidelity, so that isn't
the whole problem. Second, the FM band is pretty full here so it may be
hard to avoid interference.

Does anyone have relevant experience with PA systems for modest-size
groups? We don't want a bull-horn, and don't need rock-band volume, but
want good fidelity and enough volume to handle say 100 people inside a
community-center-type room (typically hard walls, tile floor, acoustic
tile ceiling).
Is there a convenient clip-on mike with wire connections if the FM
broadcast scheme fails?
Any suggestions for an alternate system? We could do without the
CD player and tape and radio if necessary.

N5AU broke the old USA multi-multi record and beat the group that has
been winning these things lately (W3LPL). We had something like 6600
QSOs, 190 zones and 700 countries for 17.2M or so. Unfortunately for us,
YAECO (Yet Another East Coast Operation) from W2-land was a little more
successful and finished on top. *Sigh.*

Maybe it's time to dismantle everything and move to Joisey.

My fathers Volvo 480 suffers a fuel-injection 'hiccup' whenever i key
or de-key my 50-watt 2-meter radio. I have also set off auto alarms with
25 watts on 440MHz.
The local Volvo dealer was useless at helping with the problem of the
glitchy fuel injection; he has tried to get help from the factory in
Sweden, but there seems to be a chasm of misunderstanding between
'the real world' and 'the factory'.
Also i am told that some Toyota models have a nasty harmonic of the
digital clock xtal which hits 145.4MHz.

The preliminary total from PJ1B comes to not quite 60 million points.
They made something like 21,105 Qs in 189 zones and 804 countries.
The preliminary total for PJ9W comes to around 53 million points.
Not too shabby. Haven't heard the total from P40V yet.

73,
Bob K2PH

I need some advice. It looks like I will be moving up to Wash. DC soon & will be in a 1st floor condo. This will force me to leave my tower, beams, etc. behind (boo, hiss). As you might have already guessed, the management has antenna restrictions. The good news is I can put up a relatively (?) unobtrusive antenna (i.e. vertical) while operating, as long as I drop it when I'm off the air. My father-in-law has been operating this arrangement with the Cushcraft R-4 (R-3?), 10-15-20 vertical. This is a nice arrangement as it requires no ground radials & I will have very little real estate (fenced patio w/ micro-lawn). However, I would like something that will also work 40m.

Since I will be operating from ground level, I can probably use something that can be ground mounted, although I may also be able to elevate it about 10' on a single piece of mast.

Ideally I am looking for a vertical that can:

1) operate 10-12-15-17-20-40m (don't care much about 30)
   10-15-20-40 is the minimum.
2) requires no ground radials.
3) can be easily broken down to parts < 15' for storage in the back yard.
4) costs <$200.

Any ideas?

73 de Mark

6Y5/WD3Q DXPEDITION SUCCESS

HR AMSAT NEWS SERVICE BULLETIN 300.01 FROM AMSAT HQ
SILVER SPRING, MD OCTOBER 27, 1990
TO ALL RADIO AMATEURS BT

WD3Q DX-Pedition To Jamaica A Major Success

Eric Rosenberg (WD3Q) recently returned home to his QTH in Washington, D.C. after his AO-13 DX-Pedition to Kingston, Jamaica. Enjoying the hospitality of Hugh Brand (6Y5HB), the only ham in Jamaica on the OSCARs and using Hugh's satellite equipment, Eric gave a "live" demonstration on Oct. 13th to a group from the Jamaica Amateur Radio Association at their club station, 6Y5RA. Included in this group were non-hams consisting of government officials interested in the emergency communication possibilities of OSCARs. During the Mode B session, Eric made 35 contacts with hams in six countries on three continents. During the demonstration, everyone was able to see a map from QUIKTRAK showing the sub-satellite point of AO-13's ground track. The video monitors were made available through the kindness of a local audio-visual company in Kingston. After the AO-13 pass, Eric gave a slide presentation about the current flock of MICROSATs and what is on the horizon for AMSAT satellites. Also, during his presentation, DO-17 pass came by and using the WhatsUP program, decoded several frames of telemetry "real-time." After the demonstration and presentation, several hams indicated that they would now start on working to become active on the OSCARs. For those lucky few who made a contact with 6Y5RA, you can send your QSL to WD3Q, 338 14th. St., NE, Washington, D.C., 20002.

S-BAND OSCAR SPECTRUM THREAT

HR AMSAT NEWS SERVICE BULLETIN 300.02 FROM AMSAT HQ
SILVER SPRING, MD OCTOBER 27, 1990
TO ALL RADIO AMATEURS BT

Potential Loss Of OSCAR S-Band Spectrum Looming On The Horizon In WARC-92

The FCC has released a 150 page document known as the "Second Notice of Inquiry (NOI)" which outlines the U.S's proposal for the World Administrative Radio Conference (WARC) to be held in Spain in February '92. It outlines several different plans to reallocate the spectrum in the Amateur Radio Satellite service in the frequency range of 2390-2450 MHz. At the recent AMSAT-NA Space Symposium in Houston, TX on Oct. 20, Jan King (W3GEY), AMSAT-NA VP of Engineering, expressed his feelings about the devastating affect this would have on future OSCARs. In what is a very complicated issue, radio amateur use of this portion of the 13cm spectrum would cease so as to accommodate land-mobile systems radio. Also, there is even more pressure to take this spectrum away from radio amateurs by digital audio broadcasting concerns who want to deliver compact disk quality sound service via satellite. In the next couple of weeks the AMSAT News Service (ANS) will be providing more information about this US WARC-92 proposal found in the FCC's General Docket 89-554, paragraphs 84-105.

Recent AMSAT-NA Board of Director Appointments

At the AMSAT-NA General Meeting held the weekend of Oct. 19-21 in Houston, TX, the AMSAT-NA Board of Directors (BoD) elected the following individuals to serve as officers of the organization for the coming year:

Doug Loughmiller	(KO5I)	President & General Manager
John Champa	(K8OCL)	Executive VP
Ray Soifer	(W2RS)	Senior VP
Drew Deskur	(KA1M)	VP Special Projects
Jan King	(W3GEY)	VP Engineering
Courtney Duncan	(N5BF)	VP Operations
Jeff Wallach	(N5ITU)	VP Field Operations
Andy MacAllister	(WA5ZIB)	VP User Services
Bill Tynan	(W3XO)	VP Manned Space Operations
Art Feller	(KB4ZJ)	Treasurer
Martha Saragovitz		Secretary

The AMSAT-NA BoD has created a new position known as the VP Publications but at this time nobody has been selected to fill this position. Please stay

tuned to ANS bulletins next week about further announcements of appointments made by the AMSAT-NA BoD.

OPERATIONS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 300.04 FROM AMSAT HQ
SILVER SPRING, MD OCTOBER 27, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule Announced

AMSAT Operations Nets are planned for the following times.
Mode B nets are conducted on an AO-13 downlink frequency of 145.950.
Mode J/L nets are conducted on an AO-13 downlink frequency of 435.970.

Date	Phs	mode	UTC	NCS	Alt.	U.S. day
03 Nov 90	98	J/L	1500	N5BF	WD0E	Saturday
10 Nov 90	96	J/L	1835	WA5ZIB	WB6LLO	Saturday
17 Nov 90	145	B	1300	KA5SMA	WB9ANQ	Saturday
24 Nov 90	97	J/L	1430	WD0E	N5BF	Saturday

Nets are scheduled for North American geographic coverage and time zones although other parts of the world are often within the footprint and check-ins from everywhere are welcome. Those who don't have adequate and convenient coverage from this net are encouraged to schedule their own nets via AO-13. Write to AMSAT Headquarters with your schedule and we will run it in ANS.

For information on the amateur satellite program and how you can participate, contact AMSAT-NA Headquarters at P.O. Box 27, Washington, DC 20044, phone (301) 589-6062, or contact your local AMSAT Area Coordinator.

FALL AO-13 TRANSPONDER SCHED

HR AMSAT NEWS SERVICE BULLETIN 300.05 FROM AMSAT HQ
SILVER SPRING, MD OCTOBER 27, 1990
TO ALL RADIO AMATEURS BT

The transponder schedule for AO-13 is as follows:

Mode-B : MA 000 to MA 095
Mode-JL: MA 095 to MA 125
Mode-LS: MA 125 to MA 130
Mode-S : MA 130 to MA 135
Mode-BS: MA 135 to MA 140
Mode-B : MA 140 to MA 256
Omnis : MA 220 to MA 040
This schedule is expected to continue through 26 Dec 90.
The Command Stations have oriented the spacecraft to an attitude of:

BLON = 180 and BLAT = 0

Further attitude refinement may be performed.

AMSAT-OSCAR-10 appears NOT TO have been receiving sufficient solar panel illumination to support Mode-B transponder operations. Both beacon and transponder signals show signs of FMing. Until further notice please DO NOT use AO-10's transponder.

It is expected that AO-10 may once again receive sufficient solar illumination to support Mode-B transponder operation by sometime in November.

Command Station Development Programs Announces Two Promotions

Bruce Rahn, WB9ANQ, AMSAT Command Station Development Program (CSDP) Technical Coordinator is pleased to announce the promotion of the following individuals to Level-1: Tom Davis, KB7HTA, and Dusty Warner, KF4AU. To be promoted to Level-1 in the CSDP, an individual must demonstrate the ability to receive, reduce, and analyze telemetry data from a significant number of operational amateur radio satellites as well as the ability to work with other people in support of on-going and future AMSAT projects. Tom and Dusty are to be commended and congratulated on this significant accomplishment.

Additional information on the CSDP may be obtained from Bruce. Please send a SASE with one unit of postage to him at 410 Coronado Trail, Enon, Ohio 45323.

FO-20 CONTINUES OPERATION

HR AMSAT NEWS SERVICE BULLETIN 300.07 FROM AMSAT HQ
SILVER SPRING, MD OCTOBER 27, 1990
TO ALL RADIO AMATEURS BT

Both Transponders Operational during Fever

Command stations for Fuji-OSCAR 20 have turned on both transponders (JA and JD) of the feverish satellite. It has been determined that transponder operation has little effect on the internal battery temperature and so it was decided to leave both transponders on. FO-20 has been in a non-eclipsing orbit since mid-August which means that the satellite is constantly in sunlight. The battery temperature has risen to about 40 degrees C (normal operation should have the battery temperature between 0 to 5 degrees C).

The command team for FO-20 will be constantly monitoring the telemetry from FO-20 and may, without warning, turn off the transponders if it is deemed

necessary for the satellite's well being.

AMSAT SYMPOSIUM HUGE SUCCESS

HR AMSAT NEWS SERVICE BULLETIN 300.08 FROM AMSAT HQ
SILVER SPRING, MD OCTOBER 27, 1990
TO ALL RADIO AMATEURS BT
Largest Turnout Yet for AMSAT Space Symposium

The Johnson Spaceflight Center (JSC), near Houston TX was the site of the 1990 AMSAT Space Symposium and was deemed an unqualified success by its over 225 participants. The JSC Amateur Radio Club (JSC ARC) sponsored the event which took place in the JSC Visitor Center Auditorium. 22 talks were presented over the three day event. Subjects of the talks ranged from an update on the Microsat operation, to beginner's sessions on what it takes to operate through a satellite, to a look at possible new satellite projects AMSAT may take on. Ron Parise WA4SIR, along with Lou McFaddin, W5DID, presented a talk on the Shuttle Amateur Radio EXperiment (SAREX) program. Lou spoke on how the concept was developed and "sold" to NASA management. He also brought some of the prototype and flight hardware to be used on the STS-37 flight (which will have at least 4 hams on-board). Ron spoke of his mission on STS-35 and how the amateur operations will be "fit-into" his mission time line.

Saturday evening offered a taste of southern hospitality and cuisine at the JSC Recreation Center. A Texas Bar-B-Q Dinner was enjoyed by the participants which was followed by the AMSAT Annual meeting and Awards Presentation. After Sunday morning's talks, a number of attendees toured the station of Dave Blashke, W5UN, the site of the largest two meter EME array (see Jan 1989 pg 15 for a picture of the site). After Dave demonstrated "armchair" copy of SSB signals off the moon, he was presented an award for his work to rescue DO-17 (DOVE) from a condition which prevented "modestly" equipped command stations from issuing commands to DOVE.

The JSC ARC (W5RRR) has a permanent satellite station in the Visitor Center's lobby area which was used to demonstrate PACSAT and AO-13 operations. A number of attendees were also able to take advantage of the public tours of the JSC which took them into Mission Control as well as other points of interest at the facility. The AMSAT Board of Directors met that same weekend to discuss pressing AMSAT business and to set a direction where AMSAT would head as it looks to the next century.

AMSAT wishes to thank Bill Tynan, W3XO, Chairman of this year's Symposium Committee, as well as the JSC ARC who put together a well organized and exciting program. They are to be commended for all their labors which resulted in the finest AMSAT Space Symposium yet.

I'm not changing the subject. You argue that non-ham volunteers using modified
ham rigs illegally is commonplace. It may be in *your* experience, but that
does not necessarily mean that it's commonplace throughout the US. I have
never seen anyone using a modified ham rig on the public service bands in
the Houston area, and I've seen a number of the volunteer services around here
in action. Your experience doesn't generalize. Please stop acting like it does.

>THINKING going on in hamdom, then I don't regret it.

```
Sure. Just like your half-baked proposal to give ham frequencies to public
service. You're doing ham radio a lot of good.

> > Now that you realize that your conditions

Nope...but you could let the subject drop, and do as I do when someone else
expounds the virtues of no-code: grind your teeth in silence, and go on to
to the next message.

I'm surprised that in all this no one else has brought up the sometimes-
promoted genderless pronoun "na" (or else I missed it--sorry!).  This has
been advanced by some (feminist in particular?) writers as a gender-neutral
but not sexless (like "it") pronoun to indicate a person without gender
being a necessary part of the identification.  I've read a novel or two which
used "na" and it was admittedly hard to get used to, but it was at least
clear that "na" meant a person and "it" meant a thing.  Interesting.

Subject: Japan's "CQ Ham Radio" magazine (?)

About 10 or so years ago when I was working at one of the more famous former amateur radio manufacturers in Benton Harbor, Michigan, we used to get a really good magazine from Japan called "CQ Ham Radio". This periodical was about an inch thick per month (!) and had lots of great articles (in Japanese, of course). Although I could not read the text, the schematics, part numbers, graphs and mechanical drawings (thanks to the metric system) were always plenty to get the gist of the articles and also to build the equipment described. The magazine was mainly technically oriented (or at least most of the articles on DX and other nonsense were unreadable, anyhow) and it really seemed at that time to be pushing the state of the art. It also always had the announcement of radios several months before they were available in the US.

In any case, I'm trying to find out if this magazine is still published and if it is available somehow through subscription. My understanding back then was that it was available but cost ".... a couple hundred dollars [US] a year.." to receive here in the states. Perhaps most of this was the shipping. I don't really care if it gets here by slow boat as long as the articles are interesting technically. I'd like something to replace "Ham Radio" magazine in my incoming mail, and "CQ" just doesn't do anything for me. (At least "73" didn't buy it and I don't have to read Wayne Green's drivel.)

Does anyone on the net get this or know how to get a subscription to the magazine? I'd appreciate a reply by email or phone. Thanks.

John, WB4LNM

> I have been trying unsuccessfully to build an interface to my PS/2 so SuperMorse can decode the CW off my radio. I first tried a tone decoder circut, with little luck. Then, following some advise I read on this net, tried using an op-amp. This too was unsuccessful. Perhaps I am a little less technical than I need to be. So, if someone has accomplished this or knows how to convert the presence of a tone to the closing of input pins on an RS232 port, I would be forever indebted! Please reply to the net, as mail will not be reaching me soon. Thanks again!!
>
> Byon Garrabrant

I have been experimenting with circuits to decode morse on my PC for some time. Let me say right off that the CW decoding part of SuperMorse is not very good. If you have anything other than perfectly spaced NOISE FREE code the output is garbage. I think it somehow interprets noise spikes as dots, and adjusts itself to a very high speed. I never got it to work with my homebrew 'TU'. I ended up writing something myself in Turbo Pascal that is a little more cautious in the way it changes speed, and it works fairly well, although again it has trouble with sloppily sent characters.

I can't send real circuits over the net, but all you need is something like:

```
SPKR     ______> GAIN X 30 _____>  precision  ________ comparator __>
SOCKET                             rect
                                                                to rs232
                                                                input
```

The other pin of the comparator should be driven from a smoothed version of the output from the rectifier, so you are comparing the current value with the average value. This makes it less sensitive to fading. It could also use some tight audio filtering at the input unless your rig has very sharp IF filters

I drive the op amps from +5 & -5 volts, and this seems enough to swing the rs232 levels, although 15 would no doubt be better.

There are any number of ways you could do this, including PLL circuits but this works for me. I even got it to decode some HF WEFAX pictures by filtering out the 'black' tone & triggering on the 'white' one. Different software of course. If you want any more details, send me mail
Hope you get something to work
73 Mike KC1RP

At my club, we've got a HEATH contraption which decodes CW. It's made mostly out of TTL parts. I'm not sure of the model number, it's worn off of the case, but it's got a big LED display (approx. 12 characters wide). Anybody ever seen one of these?

Chris

John H. Klingelhoeffer (jhk@saturn.acc.com) asks whether Japan's "CQ Ham Radio" is still in press, and if so, how he could get it.

"CQ Ham Radio" is doing well. Its circulation is one of the three largest among monthly magazines in Japan. Although "CQ Ham Radio" is not the official journal of the Japan Amateur Radio League (JARL's official monthly publication is "JARL News", a puny pamphlet that is widely criticized as an ill side effect to JARL membership), "CQ Ham Radio" is "edited under guidance of JARL". In fact, CQ Publishing has their main office is in the same building as JARL's.

Unfortunately, it costs a fortune to subscribe to "CQ Ham Radio" directly from the publisher (to be precise, from an overseas periodical distribution agency which has sole rights to carry "CQ Ham Radio"), even if you use surface mail. The most convenient way is to buy it at your local Japanese bookstore. This only works if you live in a large city like New York, San Francisco, or Los Angeles. That would cost about nine or ten dollars. The second best way is to ask a friend in Japan to mail it to you. The magazine itself costs four dollars or so, and surface shipping is about two dollars. You'll save on money, but will be asking somebody a favor.

Since you seem to be interested in home brewing, I would recommend "Ham Journal", a bimonthly also published by CQ Publishing. This magazine is much more advanced. Each issue focuses on some particular technical topic, and coverage is fairly deep. This magazine is about the same size as "QST". "CQ Ham Radio" is for finding out the latest equipment. "Ham Journal" is for bulding your own radio. I'm making a modularized SSB tranceiver which appeared on "Ham Journal" several months ago.

Another less known publication that has homebrew information is "Mobile Ham". It started out as a magazine specializing in portable and mobile operations, when bulding small, stable, rugged radios was a major challenge. Nowadays, they deal with advanced homebrewing techniques. "Mobile Ham" is also a monthly, about the size of "QST".

While on the topic, let me add "Radio Life", a popular magazine slightly wider than a paperback book that defies the twilight zone between legality and thrill. This is a must for scanning fans. Lots of "secret frequencies" listings appear in each issue. This is your consumer guide to electronic surveillance. Find out what that couple is doing in the apartment across the street! Want to modify your car so it looks like an unmarked squad vehicle? We'll show you just how to do it -- no more parking tickets ever! In a country where not only third party traffic is illegal, but it is a felony punishable by two hundred thousand yen fine or two year imprisonment or both to merely disclose a frequency used by others for any particular purpose, this magazine has lots of guts. Quite interestingly, among of its avid subscribers are newspapers and TV stations -- they depend on police radio traffic to miraculously appear on the scene. And even though police radio is now digitized, zealous "undercover monitoring" fans have allegedly cracked the code, bringing in windfall profits to Japan Radio Company, the major supplier of radio equipment to public services in Japan.

Oh well, I ramble too much.

If you have any more questions, please let me know, and I'll respond.

Here is proposal that may actually accomadate everyone, CODE and NO-CODE

The following licensing idea came to mind after reading all of the notes in this file about the "Communicator Class" and "Incentive

Licensing"

We could actually use our current system (already in place) and accomplish much of what everyone here has said or commented on.

The goal of this proposal is two fold:

1. Entry Level --- to get more young and non-technical people into this hobby.

2. Have those already in the hobby expand their knowledge of the various aspects of this hobby.

3. Make the administration of the licensing procedure less complicated. (not sure anything the government does is not complex)

Class	Elements	Options
Novice	2	CW 5 WPM
Technician	2,3a	Pick (1) from list below
General	2,3a,3b	" " " " "
Advanced	2,3a,3b,4a	" " " " "
Extra	2,3a,3b,4a,4b	" " " " "
Communicator	2,3a	* (required)

Option List: (Aside from the code Exams these tests will be 25-30 multiple choice questions designed in the same manner as we have our tests designed today however the pool of questions should not be made public)

a. Packet
b. RTTY
c. CW 10 WPM
d. CW 15 WPM
e. CW 20 WPM
f. Microwave
g. Emergency Service / Operations
h. Net Operations / Control
i. SSTV
j. Community Service
*k. UHF/VHF Operations
l. Satellite

(The above list is not all inclusive)

All current allocations and privs remain the same.

All current licenses are grandfathered.

If the the current proposed Communicator Class is approved the 5 WPM
Code will be required for upgrade to Technician. (this assumes that
the VHF/UHF privs are different for Technician and Communicator.

The desired results here are that:

1. Everyone can get into the hobby.
2. Those with higher levels of license have a good background into more of the hobbies aspects.
3. We can maintain the same licenses structure and have it mean more to be a certain class then it does now.

I have had limited experience with this. My 1974 Volvo 174 once had a
problem with the fuel injection shutting off every time I keyed the mike
on my 2M rig. It turned out to be a bad control unit. The unit was

made by Robert Bosch, if I remember correctly. I had contacted the local Bosch facility and they promised to get information and get back to me; they did not. However, I replaced the unit and the problem went away. I was told that they did not have adequate RF shielding in 1974, but as of 1975 they addressed the problem. I went to an independent Volvo mechanic who diagnosed the problem and even told me to replace the unit myself rather than pay him labor to install it; he purchased it for me and he took the old unit to return.

When I had the 2M rig in our 1984 Volvo 240 there was never a problem. My 1988 Toyota Supra is loaded with electronics and computer controls. I have not yet had a problem at low power or at 45W with my Icom 27H.

I would suggest you check other Volvo dealers and any independent Volvo service facilities for advice. Remember to route the power lead and radio as far from electonic components in the car as possible, as well as the coax to the antenna. Check a service manual to see where the components are located. Also, it is claimed the best method is to hook both the positive lead and the ground directly to the battery (I believe Volvos all have a terminal block near the battery where you can connect the leads). I ran the hot lead to my battery in my Supra, but ran the ground to a chassis ground under the center console where the radio is mounted.

However, manufacturers should really have information on RFI problems and solutions. I believe I once read where GM does have information on radio installations. You might also want to contact area companies that specialize in installing commercial radios in vehicles. I am sure they would have solutions to the problem. I don't know if the FCC has any regulations covering RFI problems in cars, but you might want to contact them just to see.

Good luck,

This is the crux of the whole debate right here in two statements.

How is NOT REQUIRING CW the same as DENYING THE OPPORTUNITY TO LEARN CW??

The No-Code people are advocating it's elimination from the test, not the
banning of CW.  The Pro-Code people equate non-testing with forbiding it's
use.
If anyone wants to learn it, fine, but I still haven't seen any LOGICAL
reason for making everyone do it.

Well, the catalogs which are handy seem woefully out of date but...

A very cursory look makes me think that MAR-1 thru MAR-8 are
MiniCircuits numbers for MSA-01 thru MSA-08 all with the Avantek
85 package which MiniCircuits calls a VV-105 package.

I really *must* get some newer catalogs though...

I think you'll find that ARRL is a lot goosier about losing their tax status and is probably playing it safe. Let's face it, if they had to start paying income taxes on the publishing empire, they'd be in real deep trouble.

>I am not all that familiar with the repeater system (frequency allocations, ownership, etc.) in the U. S.
>
>I am especially puzzled with the concept of "open" and "closed" repeaters and how the latter fits in the picture of amateur radio. Can someone please clarify this terminology for me?

There are two types of amateur repeaters in use in the USA.

1. Open. An open system welcomes all users. It may use technical access controls, but the access information is widely and freely available to everyone. New users are actively welcomed to the system.

2. Closed. A closed system welcomes only a specific group of users. It may use technical access controls and attempt to keep access information restricted to the group. Or it may not use technical access controls, relying instead on group pressure to discourage non-members from using the system.

>As far as I understand it, there are a multitude of "private"
>repeaters. What's the point in having a dozen repeaters in a
>questionable QTH (and limited range) in comparison to ONE good
>repeater in a high (broadcast) tower or similar? Or ARE they actually
>all that good?

Most repeaters of both types are located on good sites. Some of the very best repeaters, in a technical sense, are closed machines while some of the very worst are nominally open. There are machines of excellent quality of both types in this area. Access to excellent sites is often as easy for an individual as it is for a club. Very few repeaters operate from the home of an individual. Many excellent sites are available to amateurs either free or for a nominal rental. There are two amateur systems operating from the broadcast tower where I work. They are both supplied free sites as a courtesy to the amateurs.

>What would you say is an average working range of a typical repeater
>in Ohio, or any other place with flat terrain?

Average working distance varies wildly depending upon siting, technical sophistication, terrain, and co-channel interference. In the rough terrain of North Georgia, the working range of a given machine may vary between 15 and 120 miles depending on the direction of the user from the machine. In flat terrain the working distance varies between 50 and 120 miles, depending mainly on site height and co-channel interference.

>In here, ALL repeaters are club-owned and completely unrestricted for
>any user. There are currently seven (7) allocated repeater channels on
>2 meters (145.600 - 145.775, 25 MHz raster) and they seem to be
>enough.
>
>Am I missing something here?

Many machines here are club owned. Club owned machines may be either closed or open. Many other machines are owned and supported strictly by an individual. These individually owned machines may be either open or closed. In the US we have many more repeater frequencies than you do. Most of the popular channels are full in the Metro areas. Most of them are vacant in rural areas. Our bandplans are different depending on the part of the country you are in. Some use an upright 20khz spacing, others use upright 30khz spacing, and in the most populated areas, a upright/inverted 15khz system is used. On two meters, repeaters are allowed between 144.5-145.5, 146.0-147.0, and 147.0-148.0. In general the 600khz split pair is contained in one subband, however, there

are machines that straddle 147.0 in some areas. In addition there
are odd machines that use a split other than 600khz in some areas.
I guess you could say that a bigger country, bigger subbands, more
mobile amateurs, and perhaps more troublesome amateurs leads to a
completely different set of solutions than the solutions that work
in your country. Not that our solutions always work, as postings on
this group indicate!

Yes, it makes sense. But unfortunately we are dealing with an emotional
issue, which of course removes any logic from the discussion. Most of
the arguments against can be re-phased as 'I had to so everyone else will.'
Another variation is 'It keeps out the rif-raf.', but of course 14.313 and
14.145 is somewhat hard to defend in this argument. Most arguments for are
generally sound.
Personally, I don't see the problem with a VHF/UHF unlimited license without
code. It won't make a bit of difference to my HF operation, I doubt it
will affect my DXcluster operation, but it might make getting into the BBS a
little more difficult. On the positive side maybe I will find someone
to talk to on VHF SSB that does not require a huge weak signal antenna.
Another positive point is that I might find a reason to invest int TCP/IP.

Followup-To:

Here are some QSL routes for some stations on
from this weekend's CQ WW DX contest.

6I2A via XE2AQ
YM??? via HA0NNN [Sorry, I did not write down the full call
on the slip of paper I brought in to work.]
ZF2JI via KG6AR
XW1L via W3HUP
IQ4A via I4VEQ
FJ9A via FJ5AB

If others could post QSL routes that they copied, it would reduce the
number of requests on the net. If I don't see the ones I need in the
next few weeks, I will post a request.

P.S. Don't you hate it when DX'ers refuse to give out QSL routes on
the air and just call QRZ?

I must not be the only person getting tired of all the postings about cw, so let me add one more :-)

Lessee. If you want a license to transmit on the HF bands, you will find that there are two major and about equally popular ways in which such transmissions are made. One is by voice (which took us all several years to learn when we were small) and the other is by cw (which can be learnt at the basic level in a much shorter time). Nobody is so set in their ways that they know for sure that they are never going to use one or other of these modes. That is why everyone who wants an HF transmitting license should have some basic familiarity with both modes. Thus, there are questions on the exams about international phonetics - whether or not you think you will ever use voice. There is also a test of very slow speed morse code, whether or not you think you will ever use cw. Once you have demonstrated the basic skills you can get on the amateur bands and use either or both of these modes. If you want to make contacts with overseas stations, you will find that about half of them are using one of these modes and half are using the other (at any one time). Knowing the basics of the morse code, you are in a good position to start communicating with others using this mode, just as knowing the international phonetics helps when you first go on the air using voice.

OK. If you want to go on VHF, where people generally work with much stronger signals and the majority use voice to communicate (it is undeniably faster when signals are strong), there is no particular reason to learn the mode that is less common, and that is why we will probably have a VHF license that does not require one to demonstrate ability to decode even the slowest speed morse code.

If you know for sure that you are want to get on the HF bands and only ever talk with people across town who are nice and loud, then you might just as well use the telephone - it's more private and it's free.

Of course cw is not for everyone. Nor is voice. Nor is being able to calculate time constants of various combinations of resistors and capacitors nor many of the other things we are tested on in order to have a transmitting license.

If, once you are on the air, you decide you don't want to use morse code, then don't use it. If you decide that voice operation takes up too much frequency and the consequent crowding of the band is not to your liking, don't use voice.

Does any of this make sense?

If the 470 is that good a radio, it will keep its value. The only reason
someone would be letting go at that price is if the radio is broken, or
just totally ruined (e.g. scratched all to h*** and painted pink).

>Any suggestions or offers out there?

Get an IC-2AT use for the time being. You can get almost everything you
put into buying a used one back when you sell it (if you don't break it
or paint it pink). These radios seem to be fairly stable in value even
with use. Alternatively, the Yaesu FT-727 seems to be going for quite a
low price. The battery packs are NOT compatible between 727 and 470.

>Thanks for any help you can offer.

That's the best I can do, short of suggesting that you rob a bank, and if
I did that I'd probably get flamed that it was a violation of some rule
somewhere :-)

Pete,
By all means hand out ARRL membership forms, we can use the money!
We just had a dues increase and the ARRL is having money problems too.
Good Luck

Name a time and place Brian, I'll be there. Ca to Tex 40M around 0400Z
looks good.

I don't run power, I don't do windows and on 40M I run a random wire 85 feet
long up 8' max. Thats why I run CW. On SSB I can't get arrested, but on CW I
can work anybody I can hear until my fingers fall off. I use a keyer and
Bencher paddles and am used to giving novice tests at 5 WPM. I used a computer
to generate code speeds from 5 to 35 WPM and learned how to match my own
speed and spacing with lots of practice. If you like it perfect, I'll use the
computer and keyboard but that's bad for learning as it's too perfect. It's also
sterile and un-human. CU QSY 7.125.

I would like to get in touch with anyone using an Icom IC-745,
especially if you:
a) have a service manual, or
b) have successfully changed the backup battery.

I would like to change mine BEFORE it dies, and the rig gets
total amnesia...

Any other hints & kinks would also be appreciated

| I agree with you there. In fact, I would like to ask whether
|any VEs are giving the code exam with multiple-choice questions. It
|seems to me that such a method would partially defeat the purpose of
|the test. The fill-in-the-blank questions that I had to answer when
|taking tests from the FCC examiners are a better check of accurate
|copy.

When I took my code test two months ago (and STILL no certificate!), the
VEs DID use a multiple choice test for those who failed to copy one
solid minute.   In fact, the pre-test instructions included hints like:
"listen for key phrases such as "My name is..." We were then supposed to
listen very hard for the next letter. If the next letter was, say, M
and the multiple choices for the senders name were Martha, Jim, Sam, and
Tracy.... well, you can see how it goes....

I learned the code and enjoyed it but doubt I'll use it in practice. I
think the point here is that if your VEs are no-coders, you can fulfill the
letter of the law with very little effort.

That is sure different from the test I took last summer. The instructions were emphatic that your fill-in-the-blank answer had to be exactly as sent, or be marked wrong. As an example, if the senders QTH was sent as "paramus, nj" and you wrote "paramus, new jersey", or "paramus, n.j." it would be marked wrong.

In addition, the test leaned towards questions that you couldn't answer from context if you had missed a key character, like "how high was the sender's tower?" (something like 179 feet) or some third parties call sign that was mentioned.

Multiple choice sounds like a piece of cake in comparison. Just out of curiosity, which VEC was it? What other big differences in procedure are there between VEC's besides the code test?

I have finally decided on which HT I want to TRY to buy. It's the Yaesu FT-470.   I've been told it retails for around $400, but can sometimes be purchased for under $400. Problem is, I've only got about $200 (plus or minus $50) to spend. Anyone know how I can get one for that price? I will accept a used one from someone provided I can get a written guarantee from that person that the unit is in perfect working order AND that if something does go wrong with the unit, that I will be able to send it back to the person and get a full refund.

Any suggestions or offers out there?

Thanks for any help you can offer.

This is appropriate for private communications.

For government, public agency etc communications, maybe not.

We have the Freedom of Information Act, lots of restrictions on what can be discussed at "closed door" meetings of city councils, and declassification of things that don't really have to be secret.

If government communications is done on a "need to encrypt" basis, there should still be a lot of interesting stuff out there.

On the ham bands of course, we have only a limited opportunity for legal encrypted communication.

> Please don't tar us all with that brush, as you have been wont to do.

Quit living in the past, Jay. I think the statement was clear enough in being limited to a select few hams.

> The second part of that is something I don't condone, but I again suspect you're tarring many, many volunteers with the brush of your bad, but local, experiences.

I don't think my area is _that_ unique. If some people are using illegal radios in Rochester, NY, then some other people are using illegal radios in Houston, TX and a lot of other places.
I am not "tarring" volunteers in general, just the ones with the Ic02ATs and such. Don't change the subject.

> > On this we agree. As a group, ham operators are more sensible than that. But there are those who behave exactly as described above. I just don't believe in encouraging them, or sitting by idly while they try to persuade the more sensible that they can justify it.
>
> So, instead, you establish a reputation for yourself as the famous flaming FidoNet newbie? Seems a bit counterproductive.

I didn't attach that appellation to myself - you did. And nobody else that I know about has picked it up. If a little of what you call "flaming" gets some discussion, and more importantly, some THINKING going on in hamdom, then I don't regret it.

> Then why do you toast people in other areas based on your

> (admittedly bad) local experiences??

See above. Statistically, it would be naive to think that I am the only one who has seen this type of behavior.

> >   I don't want a big fight to start over this. These are local
> >conditions and I don't apply them to the situation in general.
>
> Yes, you do...you did in the message that started this war, and
> you did in
> your replies to me. Now that you realize that your conditions
> don't apply to the whole world, how about lightening up?

I believe that is what I was doing. What do you want me to do, bare my throat to you?

I certainly didn't make it *that* tough on myself, but for you net newcomers out there, I'll briefly mention that all my awards were earned by running 100 watts into an aluminum porch awning. (Yes, including the DXCC. I'd worked 133 countries by the time I retired the awntenna a few months ago.)

Here's a collection of reposts for all those who want to know how to program their IC-24AT to extend its frequency range, and its performance outside of the normal bands. Thanks to all concerned for their contributions.

```

```

This is an attempt to document all of the known key sequences for the ICOM IC24AT (144/440MHz dual band hand held). Some key sequences may be common with the IC[2,3,4]SAT, therefore a few key sequences for those radios are also on this list. Some key sequences require options (such as the PL encode/decode board).

This is not designed to replace the owners manual, but to summarize the information in one place.

Note: Many controls vary depending on the current mode, i.e.: Scan up/down will search frequencies when in VFO mode, and will scan memory channels when in Memory mode. Consult the owners guide for complete information.

```
KEY/COMBINATION = Result, action
----------------  --------------------------------------------------------------
0-9,A,B,C,D,#,* = note: when transmitting these will generate DTMF tones
0-9             = Enter frequency (can also use the VFO knob)
A               = VFO mode / clear incomplete entry
B               = Memory mode
C               = VHF / UHF change
D               = Call channel
*               = Step frequency down/scan down
#               = Step frequency up/scan up
MONI            = Open squelch and change to input frequency (if not simplex)
                   while button is depressed
H/L/DTMF        = Select High/Low power, or (while transmitting) send
                   preprogrammed DTMF codes

FUNC + 0        = Dial set
FUNC + 1        = PL enable (when option is installed)
FUNC + 2        = Code squelch [NOT for the IC24AT, IC[2,3,4]SAT option only]
FUNC + 3        = Skip memory
FUNC + 4        = Duplex operation
FUNC + 5        = Code [NOT for the IC24AT, IC[2,3,4]SAT option only]
FUNC + 6        = Mask frequency
FUNC + 7        = Priority mode on/off (operation dependent on current mode)
FUNC + 8        = Set mode (several different functions, press A to exit)
FUNC + 9        = Real time clock and timer functions (press PTT to exit)
FUNC + A        = Memory to VFO transfer
FUNC + B        = Memory Write
FUNC + C        = Split operation (cross band full duplex)
FUNC + D        = Lock mode / Cross Band Repeat disable
FUNC + *        = Scan programmed limits (down)
FUNC + #        = Scan programmed limits (up)
FUNC + 5 + D    = Cross Band Repeat enable (split mode must be on!)
                   Diode D14 (right diode on CPU board) must be removed to
                   enable the use of this function)
FUNC + MONI     = RX/TX light enable / disable
FUNC + H/L/DTMF = Select DTMF Autodialer memory
Func + VFO knob   = Change frequency/memory channel
                   (according to dial set, see FUNC+0)
Func + LIGHT  = Lock light on (don't time out)

H/L/DTMF + VFO knob = Change output power (4 power levels when using 13.8 vdc)
```

The following key combinations selects "power on modes". Start with the radio OFF, then hold down the indicated keys, and continue to hold them while turning the power ON. Some 'modes' override others.

```
LIGHT + *      = PTT enable
LIGHT + 0      = PTT Disabled (inhibits the transmitter, good security method)
LIGHT + 1      = 1 MHz digit set (4 digit frequency entry)
LIGHT + 2      = 10 MHz digit set (5 digit frequency entry)
LIGHT + 3      = 100 MHz digit set (6 digit frequency entry)
LIGHT + 4      = Scan pause until signal disappears
LIGHT + 5      = Scan pause for 10 seconds
LIGHT + 7      = Power Save deactivated (use this for packet operation)
LIGHT + 8      = Power Save (minimum - 0.125 / 0.5 second)
LIGHT + 9      = Power Save (maximum - 0.125 / 2.0 seconds)
LIGHT + B + #  = RX Extended Range enable
                  This requires that diode D13 is removed (left diode on
                  CPU board).  Note that this diode has already been removed
                  by ICOM at the factory on many units.  Be sure to hold
                  these keys down until the activity display stops and is
                  showing a receive frequency.

FUNC + A       = Reset the CPU (this will clear all the memory channels).
```

Has anyone actually tried this, and did it work? What is your serial number?

I bought my 24AT last weekend and it's great. I recommend replacing the antenna with one from a 32AT - several S-units better on 2 meter receive. It doesn't do crossband repeater as-is, but there may be mods for this. It does do crossband full duplex. I'm used to Kenwood products, so the labeling and key sequences seem a little convoluted, but I'm rapidly adapting. As-is, XMT/RCV 140-150, 440-450, and RCV only 138-174. Almost everything with the radio is programmable, separately if it is unique to a band (duplex offset, band scan limits, freq step, etc.). A full-featured micro dual-bander.

I received the following mods for 24AT out-of-band from a very reliable source (although they don't specify RX only or RX/TX), for 75-195 MHz, 200-490 MHz, and 740-960 MHz. Rumor has it (unconfirmed) that the unit even switches to AM in the air band!

1. Remove diode D8 [see figure below]

2. Attach diode D7 [I believe this is already equipped]

3. Attach diode D12

4. Remove diode D13

5. Simultaneously hold "LIGHT", "B", and "#" keys and turn the power on. Release all keys after the display goes out (checks all LCD segments). [This is supposed to enable the out-of-band frequencies above]

6. Simultaneously hold "LIGHT" and "2" keys and turn the power on. This enables the 10 MHz frequency digit entry.

7. Simultaneously hold "LIGHT" and "3" keys and turn the power on. This enables the 100 MHz frequency digit entry.

WARNING: I have NOT tried the hardware mods and cannot vouch for them, so proceed at your own risk!

I am told that the newer 24AT's (believed not to have made it to the US yet) will have the hardware mods in place, so only steps 5-7 will be necessary. So, try this first. Steps 5-7 don't seem to have any effect on a 24AT without the correct hardware mods. BTW, this has been attempted on 2 units with serial numbers around 1000 and mid-1100's, neither of which worked. :-(Like I said, the ones with the mods aren't here yet.

There are 5 screws to remove the case (5th is on the strap hook). Keep the top panel controls with the front of the radio, and be VERY careful pulling the back off because there are fine ribbon cables connecting the front & back. I don't think they'll take much flexing.

Additionally, diodes D7, D8, and D12 are surface mount components. They contain 2 diodes connected to 3 pins. Diodes D7 and D12 are different configurations. I believe D8 and D12 are different, so I wouldn't put the removed D8 in the spot for D12. Since they are surface mount, removal of D8 may not be all that difficult for those with steady hands and a fine low power soldering iron, but adding D12 would be a bear. I know of no reason that small discrete diodes couldn't be used in for D12. D13 is a small but standard axial diode, and can be easily cut.

It is for this reason I have not attempted the hardware mods. Now, if the referenced posting is correct, and only D13 needs to be cut... I'm guessing, but it could be that the rest of the diode changes are for the 10 MHz & 100 MHz digit entry (which I'd like but could live without) or out-of-band TX, or the like.

If anyone has tried only cutting D13 and resetting? Did it work? What is your serial number? Please post to the net!

If I learn more, I'll follow up.

> What is the TRANSMIT range when the mods are done to the IC-24AT?

Transmit range doesn't appear to be affected unfortunately. I was at least hoping for 420-450 coverage. BTW, I tried each amateur band from 6m to 23cm. The PLL doesn't lock up at either end. Another negative is the frequency step on 220 doesn't allow one to hit each possible repeater slot.

All in all, not too bad. Now if I can get the cross-band repeater function...

The mods posted for the IC-24 enable the wide receive only (as far as I know). However, the good news is that there are more mods on the way such as direct entry of MHz when out of band. BTW the out-of-band sensitivity is very good (blew the doors off a BC-200xlt), except near the ends of the range.

Per the posted information and current discussion on the modification of the **new** ICOM 24AT dual band HT:

The Modification for freq. coverage extension:

1) Remove Diode D13

2) Keyboard [B,#,LIGHT] & Power-ON

Does work... FOR RECEIVE-ONLY!

The process is relatively simple; considering that most of the entire radio is surface-mount parts... It turms out that Diode D13 is one of two "normal" sized diodes on the LOGIC BOARD easily accessed and cut when the radio is opened...

(Two "standard" diodes are found below the logic IC1 by about a 1/3inch, with IC1 at the top, looking at the diodes D13 is the one on the left.)

Result: Recieve results (rough-info for about 6 hours of use after mod)

VHF: PLL begins to lock in at about 75mhz ... and goes out of lock at about 280mhz
(display will go 0mkhz to 355mkhz)

UHF: PLL begins to lock in at about 355mhz and goes out of lock at about 500 mhz...
PLL begins to lock in at about 795mhz and goes out of lock at about 975 mhz...
(display will go 355mhz to 1310mhz)

Actual use/operation:

Aircraft: (108-136) seems to detect AM ok...
within 2 miles of Ohare Intl(ORD)
recieve of ground 121.--- moderate
receive of ATIS 134.--- good
recieve of tower and approach moderate
seems that high-end of band receives better.
"looks like for a pilot who desires to monitor ops at the port prior to run-up or whatever should work fine)

2m HAM: As shipped.
VHF HighBand (150-176): seems pretty hot- unit is shipped rec'ing this stuff
220 mhz: VERY Dead receive at these freq.
hears only very-local transmitters
**ALSO above 200mhz step rate is no smaller than 12.5khz
!!SO NOT ALL channels can be tuned on freq- (UUCH!)
70cm (420-450): Fine
UHF (450-476): Hot reciever! - best ham mod'd receive better than IC32AT mod rec...
470+ mhz works well- chicago has allocations of Public service and business in 470-476
...and 24at works well
800mhz (convential/trunking):
Ah..it hears the band- perhaps about the same as most scanners- Not as hot as above bands- BUT actual fairly useable!
870-890 (cellular):
Yes, but channel step rate is 12.5khz and cellular is on 30khz, so can not be on exactly every channel.

900mhz:
Did not check out much here...
did hear a few chicago
trunking systems at the
935 trunking band---
*also a lot of cellular images
present.

Bottom Line---
ICOM 24AT is a NEAT VHF/UHF/800mhz reciever and 2m/70cm HAM radio in ONE.

The modification (D13 cut) provides a manner to receive extended band coverage, without worrying about accidental transmission in other services; [however I would like to see 420-440 xmit at least as I have repeater link/control in that part of the HAM BAND; also 220 mhz freq&xmit would be real neat; as well as 900mhz xmit which a few repeaters do exist in the area]

((((one only wonders what the next generation of HTs will do???))))

I removed the D13 diode from my IC-24AT, serial number 1025, and it does enable extended receive ranges. Those below the aircraft band, however, do not actually receive the displayed frequency.

If the more extensive mod works better, someone please post results.

This is from the icom "translated fax".

Usable ranges after the mods will be:

RX: 114-130, 138-192, 403-485 & 825-903
TX: 138-168, & 410-485

In reality I have seen a great variance between different radios on where they actually lock up but I have been impressed at the capabilities of this radio

I assume you already have done the kbd mod for the out of band recieve so I will skip that part.

Order the diodes from Icom, part number 912-06015. They are about $2.50 each. A lot for a diode but not for a mod. These are tiny tiny surface mount dual diodes. They have three legs each and I forgot to see if they were common anode or cathode. Be safe and order the right ones from Icom.

Open up the radio. Clip out the glass diodes D13 and D14. D13 should already be out to enable the rx mod but D14 will enable cross band repeat. Func-C,5,D will activate the cross band repeat between two *simplex* channels.

Install the two diodes at position D7 and D12. The picture below may help find them.

I used the hottest and tiniest tipped iron I could find, tweezers and magnifying glass. Be extremely careful adding these diodes as I have seen how easy it is to lift an etch.

Sounds like an invalid test method to me. Doesn't make much difference, I guess. People will find a way to do what they want regardless...

BTW, this is not a shot at you personally. You went to the effort to learn and, I will presume, took the test in good faith. If the VE didn't bother trying to actually test the desired skill, I guess that is more his problem than yours. Besides, if _you_ want to use code as part of your amateur hobby, you will end up learning it far better by actual use than by studying for a test. Have fun!

> Lessee. If you want a license to transmit on the HF bands, you will find
> that there are two major and about equally popular ways in which

Plus TOR, FEC, Baudot RTTY, ARQ-Moore, packet, facsimile, SSTV and others even more exotic.

> Knowing the basics of the morse code, you are in a good position to start
> communicating with others using this mode, just as knowing the international
> phonetics helps when you first go on the air using voice.

Forgetting for a moment our statutory obligations and treaty terms, you are just as prepared to start communicating with hams all over the world using any of the above modes with _no_ knowledge of

Morse code. So?

How about a test on the above "exotic" modes? One should at least be able to interpret the acronyms and give a basic description of the differences. But should it be a requirement for licensing? Depends on what you think the purpose is of the exam, I guess.

I'm agreeing with you, by the way. May not exactly be easy to tell...

> If you know for sure that you are want to get on the HF bands and only ever talk with people across town who are nice and loud, then you might just as well use the telephone - it's more private and it's free.

<chuckle> Good point.

> Of course cw is not for everyone. Nor is voice. Nor is being able to calculate time constants of various combinations of resistors and capacitors nor many of the other things we are tested on in order to have a transmitting license.

That is the beginning of the sensible approach.

> If, once you are on the air, you decide you don't want to use morse code, then don't use it. If you decide that voice operation takes up too much frequency and the consequent crowding of the band is not to your liking, don't use voice.

More sensibleness. Are you sure you want to say this here? ;-)

> Does any of this make sense?

Yup. Doesn't mean people are going to agree with it, though. ;-)

      Fancy meeting you here.  ;-)

      The explanation that I remember also included the fact that
sending RYRY caused all of the mechanical parts that caused printing
to be moved, verifying that they all worked and weren't broken.

pgh@cs.brown.edu (Paul Howard) suggests:

>>"You folks..." isn't that bad. Kinda folksy.

Yes, I use that sometimes to a class of mixed undergrads. I think it's also OK to use "guys" for mixed company, but opinions differ. I can say "you guys" to my two nieces without their thinking it's funny (they're Canajuns if that makes any difference).

However, to return to the original topic, I can't see it working for the WAZ or other certificates: "said folk is hereby permitted to use the letters WAZ on correspondence originating from this folk's station".
I dunno, somehow it just doesn't sound right :-)

I wrote to the current manager of the CQ Mag awards to suggest rewording the certificates. I just know that you'll all spend sleepless nights until I can report the reply, but I will do so, assuming there is one.

I could suggest using the sound input on the new Macs or an equivalent (Mac recorder from Farallon) for the older macs, Then digitally process the signal to get the code out of it and then decode the morse.

Personnally I would demodulate the audio externally and feed the resulting digital signal to one of the handshake lines of the serial port and do only the morse decoding in the mac.

I know nothing on algorithms for morse decoding but would like to have a look at that.

```

There have been many recent discussions here in the UK about the financial
status of the RSGB. The current RSGB management has shown its ineptitude
by failing to submit accounts for two of its trading subsidiaries (which have
as a result been removed from the register of companies).
The Annual General Meeting of the RSGB takes place next month; the RSGB
council are likely to face hostile questioning from those attending; the
hall for the meeting is limited to some 200 attendees however.
(Cynics may say that, since the RSGB council will have a large number of
proxy-votes at their disposal, the limit of 200 attendees will make it possible
for council to proxy-vote through any unpopular decisions...)
At previous AGMs, there have been prohibitions on the use of portable tape
recorders to record proceedings; the 'official' RSGB transcripts of
the meetings have shown a number of what can at best be called 'creative
inaccuracies', and at worst, 'Lies'.
The really worrying thing is that the RSGB are the license-holders for all
UK repeaters. If RSGB as a body ceases to exist as a result of financial
pressures, I wonder who will take over the license-holding on repeaters?
I will be going to the AGM as an 'interested observer'; i wonder if maybe
I should hand out ARRL membership-forms as a way to show my disapproval
of the present style of RSGB 'Management' ??
More news next month...

Even the worst of the ARRL-bashers on this group (and they include some of the worst anywhere) would have to concede that the League's not in this bad condition...perceived lack of accountability (though I, for one, don't want to have to vote every time they need to hire someone!), perceived aloofness, and a perceived HF bias don't come close to financial mismanagement and fraud.

I have an ICOM 745, _and_ the service manual. Curiously, the service
manual says nothing about replacing the battery backup; in fact, it
doesn't even give more than a black-box description of the memory
module. I have a replacement battery, but haven't yet figured out get
the new battery in w/o losing everything. Supposedly one uses a DC
power supply to hold things while unsoldering/soldering the battery,
but no clues in the manual.

Any netters out there who know any more?

I'm looking for the mod for the Icom IC-745.
Would appreciate any info.

I have the mod for the Yaesu 757HT if anybody wants it.

Email only, please.

Thanks,

Were conditions fantastic, or what? People are going to be talking about last weekend for a very long time. The last two sunspot peaks weren't anything like this one. Surely the last comparable one was 1957, but that was before even a lot of us old farts had our licenses.

There must be some new record scores. Has anyone heard any? (Like P40V?)

I have been trying unsuccessfully to build an interface to my PS/2 so SuperMorse can decode the CW off my radio. I first tried a tone decoder circut, with little luck. Then, following some advise I read on this net, tried using an op-amp. This too was unsuccessful. Perhaps I am a little less technical than I need to be. So, if someone has accomplished this or knows how to convert the presence of a tone to the closing of input pins on an RS232 port, I would be forever indebted! Please reply to the net, as mail will not be reaching me soon. Thanks again!!

>"You can't leap a chasm in two jumps."

Have we QSO'd, Brian? I frequently am on the Novice sub-bands, ready to
welcome all the newcomer bI hear. I get a thrill out of being the "first"
or "second", etc QSO for the new Ham, and I hope that I'mnot causing any
undue stress by "pushing" just a little faster than he/she's sending.
I take my 100 (or less) watts and straight key down to whatever speed
is necessary if I hear a QRS.

Occasionally, I will get one of the hot-rods who sends at 10 or 12 WPM, even though he/she can't copy near that fast. By the time I find out what the situation is, there's too much QRM for he/she/(it?) to copy.

Not too long ago, I talked briefly with someone at about 3WPM.

But I agree that not enough of us will do this. Sometimes it seems as if the Novice portion is full of 20WPM.

Are you sure we haven't QSO'd? I'm gonna check my log when I get home.
Your call sure sounds familiar.

Hello to all info-hams readers.
This is a small selection of information
on the state of the Radio Society of Great Britain gleaned from packet radio in the UK. The Society has undergone a massive reversal in its affairs and begs the question "is the Radio Society of Great Britain about to go bankrupt?" The Latest figure as of 30th June 1990 is that the loss is 126,000 pounds this equates to about 250,000 dollars. Whilst this amount might seem small when view against the ARRL, it equates to about one third of the total assets.

I would be intrested in the view of other amateurs outside of the UK, as I feel that urgent advice is needed to stop the slide in the affairs of the RSGB. All comments are welcome constructive or otherwise.

  Mick G8VHB @ GB7WRG.gbr.eu   ip 44.131.2.50 root@cms.scp.ac.uk

Subject: RSGB Auditor's letter
From: G6JNS @ GB7TCM

I recently wrote to the new RSGB auditors voicing my concern about the state of the accounting systems at HQ and the fact that the two subsidiaries had been dissolved due to inaction by the Secretary. This morning, 24th October 1990, I received the following reply. You may draw your own conclusions.

Peter Goddard & Co
Chartered Accountants
London Road
Sunningdale

0990 872822
FAX 0990 872189

22nd October 1990 Our ref PBG/LAW

Dear Mr. Crosland,

Radio Society of Great Britain Ltd and subsidiaries

Thank you for your letter of 19th October. As you are probably aware my firm was appointed accountants and auditors earlier this year and it became apparent very quickly that the Society's accountancy and administrativeaffairs were in a complete mess. When we took on the appointment as auditors we naturally did a company search ourselves and found that two subsidiaries had been struck off the live register at Companies House. As you rightly say there was an inter company loan between Lambda Investments and the RSGB and we therefore sought legal advice as to what should be done. It was decided that the only course of action open to the Society would be for Lambda to be re-instated. We have approval from the RSGB for this to be done and hopefully the company can be re-instated by the time the AGM is held. In any event we have confirmed that there should be no problem in having the company re-instated and therefore the 1990 accounts reflect this fact and also the fact that the inter company debt between Lambda and the RSGB has been waived and the investment written off. This tidies up the Society's affairs and puts them on a proper legal footing. The investment in the other subsidiary has also been written off as at 30th June 1990.

You mention in your letter that the accounting procedures of the RSGB have been in a chaotic state. This is quite correct and as a consequence, Counsel (sic) employed the services of one of my members of staff on a three days a week basis. He is trying everything he can to bring things into a proper order but I think it is fair to say that he has experienced difficulties, some of which relate to existing RSGB staff and other to the computer that was installed in the early part of the year, contrary to our advice. My member of staff, Philip Smith, will be at the Annual General Meeting and no doubt you will feel free to question him at that time.

I hope that I have clarified the position to your complete satisfaction, but if there is anything you are worried about, please do not hesitate to contact me. Although you may find me difficult to contact by telephone, you are free to try and if available I will be pleased to speak to you.

Yours faithfully,

(Signed)

P.B.Goddard

So now you know and can start believing what I have been saying for years. See you at the AGM on 8th December 1990 in Bristol and as the Chinese say "May you live in interesting times".

Subject: RSGB President replies !
From: G6JNS@GB7BBS._281.GBR.EU
To : NEWS@GBR
The following questions have been asked of all RSGB Council Members.

1. Do Council receive a monthly management accounts package on a timely basis ?

2. Does this package adequately explain to you the company's present financial position ?

3. Are variances from budget adequately explained and the consequences highlighted ?

4. Are trading and cash flow projections regularly prepared for a period of at least 12 months forward on a proper basis ?

5. Are the company's present and projected financial requirements, as shown by the management accounts, within agreed bank and loan facilities ?

6. Can the Society pay its suppliers within the contractual periods of credit without exceeding agreed banking facilities ?

7. Can you confirm that the company's bankers have indicated no intention to curtail its facilities ?

8. Do you regularly review the likelihood that any contingent or prospective liability of the company may become actual ?

9. Can you confirm that no such liability is likely to become actual within the next 12 months ?

10. If any contingent or prospective liability becomes actual, will the company have adequate finance to meet it ?

11. If the company continues to trade, can it avoid insolvent liquidation ?

12. Have you taken advice on the options available ?

13. Can the company trade without relying on receiving deposits from consumer customers ?

14. Do the company's existing banking facilities permit the payment on the due dates of amounts owing in respect of PAYE, National Insurance and VAT ?

15. Have all payments in respect of PAYE, National Insurance and VAT actually been made on the due date ?

have they not been paid on time and have any penalties been incurred as a result ?

The response from the President was as follows:-

"I acknowledge receipt of your letter dated 16th October 1990, and have no comment to make on the contents other than to say that it appears that all the facts are not known to you."

So it would appear that the President is quite indifferent to the problems facing the Society and members views on the disastrous state of RSGB finances that will be partially revealed in the November Radcom. What the November Radcom will NOT tell members is how much the position has worsened since the 3oth June 1990. "Fiddling while Rome burns" is the phrase that springs to mind.

If your IC-745 is like my IC-751, it does indeed depend on the battery to support the operating system, which if lost will require shipping the module back to factory for reprogramming. There is a service note out on the IC-751 which describes supplying +5 dc while the battery is being changed. (The IC-751A does not depend on battery for operating system). The +5 would go to the cathode-side of the diode which connects the battery-positive to the load. The negative would go to the circuit which connects to the negative side of the lithium battery.

I used a different approach which you might like to consider: I left the original battery in place (it still measured the same voltage as a new one), and added a second lithium battery with its own diode....anode to battery-positive, and cathode to load (i.e. cathode of original diode). The two batteries now operate in an "OR" circuit....either or both can supply power when the AC is off.....and can easily be tested, one at a time, without danger of losing anything. A light dummy-load could be shunted across battery for more meaningful test.

WARNING: When soldering, be sure everything is isolated...module removed, or AC cord disconnected (many soldering irons are grounded-tip) which might short out your +5 vdc. A battery-operated soldering-iron would be nice.

Note that with my method (2nd battery), it was not necessary to supply a temporary +5 vdc. If you do use an electric +5 vdc, be sure its neg. is not common to the AC safety ground, unless you are certain that your soldering iron is isolated. As an aside, I remember seeing an article somewhere describing how to reprogram an Icom Receiver (7000 series) which is quite similar to the transceivers. Does anyone know if this might be possible on our transceivers?....or might even the same program work??:

In My Humble Opinion, it could be any of the following:

1) Individual Maintenance Health Organization - 100% deductible; the
    ultimate goal of the insurance industry.

2) International Mountain Hotrod Organization - Collectors of 1950
    Fords and other _Thunder Road_ memorabilia.

3) How the former leader of North Vietnam introduced himself.

>OK, I forgot about that one. Do we need any more VE's?

I think so, yes; they have to come from SOMEWHERE, right? (I'm one of
them). I mean, if this no-code nonesense generates the thousands of
hams you say it will, we VE's will be pretty busy, huh?

.-)   (half smile)

As I discern the history, one reason was so, in time of war, the
Army knew who to stick in a foxhole with a radio and a rifle, as
opposed to just a rifle.  But this was from World War One, so I
guess this is just another form of the "It's traditional" arguement.

I received a letter today from a (young?) gentleman, a Charles Hawes KB8BFM, who is interested in getting started on 10 GHz but says he can't find anyone in his area to help.
His address is 961 Elliot Street, St. Albans, WV, 25177. The postmark on the letter was from Charleston.
I will be sending him some information, but I hope he can find someone a little closer to help him out.
Thanks to the net in advance.

Regards, Stu Beal, VE3MWM, U009@CS.CCIW.CA,
National Water Research Institute,
Burlington, Ontario, Canada.

The Future lies ahead, and behind us lies... lies... lies...

Subject: Re: CAUTION! Failed an exam?

From Jim Johnson WA6SII:

> disappointed to hear the "hard-nosed" approach by the guy who does
> not normally let the examinee see his/her paper to see which questions
> were missed. I was refreshed to hear from the person who likes to
> go over the exam with the examinee so s/he can learn from their
> mistakes.

This thread is interesting, inasmuch as someday I may be a VE. Long ago
in the dim past, a person failing an exam (given only at FCC offices) had
to wait a month before re-taking the exam. Now, as I understand it, one can
fail an exam, then turn right around and re-take it minutes later. Is this
correct? Suppose I have gone over the questions the examinee missed, and the
same questions just happen to pop up on the next exam I give moments later?

How can I, as a conscientious VE, adhere to the intent of the rules in a
case like this (and it is *bound* to happen). It seems to me that I should
either not review the missed questions, or I should not allow the examinee
to re-take the exam until (24 hours? 3 days?) later. How say ye, sincere
netters (and flamer-throwers, too)?

The N5PDK dude dube@cpdvax.csc.ti.com sez:

>>Say what?? How come Derek can use the 20 wpm CSCE for 5 or 13, but can't use
>>a 25 wpm CSCE (or higher) for 20?
>>Does honor run out somewhere between the 20 CSCE and the 25 CSCE? Or is it
>>interpreted differently for a G# than it is for an AA#?

Sigh. You're trying to bait me, right? CSCE stands for Certificate of Successful Completion of Examination and is the bit of paper you get after a VE exam. A 20 wpm CSCE is what you get when you pass an FCC/VE 20 wpm test. As against a "code proficiency certificate" or whatever it is that the ARRL gives you for saying you copied their code transmissions.

>>Weaving between Derek's flames, I can see his real point, though.

OK, that's good. Many others made the same point. And anyway, I wasn't flaming, I was just setting the record straight :-)

>>73,   Dube   N5PDK

You too, Dube!

Speaking of certificates, anyone want to discuss why the WAZ and several other certificates refer to the awardee as male only? All my WAZs (how immodest) say "HE is authorized to include the letters WAZ ..... originating from HIS station". Any female ops out there with a WAZ? Do they cross out the "his" and put "her"? Does anyone find it insulting? (and if not, would you think it strange for a male op to have a certificate attesting to "her" performance?).   All the ARRL awards are clean - WAS, WAC, DXCC - although, blowing the dust off my ancient WAC from my G3 days, that did contain the mail-only language at that time.   My WAC-YL certificate is understandably Politically Correct.   All three of the Hong Kong club certificates (illustrated in the ARRL Operating Manual) are beautiful pieces of wallpaper but are all sexist in their language.   Should I send mine back in protest? Seriously, though, isn't this archaic?

+>
+>>>>>>> 31 open 450 MHz
+>>>>>>> 488 closed   450 MHz
+
+If Communicators are limited to 220 MHz and above, most are going to end
+up on 440 MHz because of the equipment availability. This is going to
+wreak havoc with the 440 MHz private repeaters. The closed club repeaters
+would be a significant problem as long as the clubs don't practice any
+discrimination on the basis of license class.

I hate to be the messenger of bad news, Phil, but this is already being done quite regularly! Most clubs advertise 'open membership' but in fact have a 2-tier system of membership that allows for exactly this type of discrimination. Here's an example of how it works:

I joined a 220 MHZ Repeater Club..let's just call it "The Club". They had an open meeting, invited the whole Amateur service to attend, get aquainted and maybe join up. I went..it was held at a restaurant. The membership chairman tendered my $25 and gave me an "Associate Membership" card, saying that it was good for 1 full year, and that after that year I could petition for full-membership..PROVIDED THAT ONE OR MORE REGULAR MEMBERS WOULD SPONSOR ME. I didn't actually realize what that meant at the time.

The public portion of the meeting lasted from 5:30 to 7pm, then the regulars and the newly-minted Associates moved from the public dining area to a back-of-the-restaurant banquet room. The President and VP joined in thanking us for taking associate membership; then they explained how the club operated.

There were 22 regular members. 5 of which comprised the TECHNICAL STAFF, these were the guys that actually kept the repeater running. The remaining 17 were the MANAGEMENT STAFF, all club offices, Pres, VP, EVP of Membership, EVP of Publications (they have a monthly newsletter..like most ARC's), EVP of Events, EVP of PR, etcetra...on and on they introduced these people to us. Most of the "officers" were members of one of the 4 families that seemed to be involved with the club...!!

Regular members were the ONLY ones allowed to access the phonepatch, the talking s-meter functions, the cross-band link to 2m, etc. RIGHT! The associates were allowed to use the machine, and attend the open-meetings but not the business-meetings, or the vote-meetings. UHUH!

Most of us left the meeting wondering what we'd just spent $25 on! It would become clearer in the days ahead..it started with the rejection of an article that my friend and I wrote for the club newsletter. "Too technical!" the EVP of Publications told us, "No one cares about that mumbo-jumbo!" He had asked for contributions at the next meeting, saying that there's always room for some more "well written articles"...the next newsletter featured badly done xerox's of photos taken at the last dinner function. The people in the pics were (surprised?) the regulars and their kids. He also included a poem about Amateur radio that his daughter had written for her 7 grade English class.

Then the repeater turned to shit as the jammers began harassing everyone, my friend and I t-hunted one of the offenders to his QTH. When we presented the information to the Club Pres., he took the paper we offered, crunched it up and tossed it into a trashcan saying: "We're not going to do anything about this, if ignored it will stop..."! We later found out that the jammer was a former "associate member", he was also a cousin of the Pres!

My friend stood up at the next meeting and announced that he would not be a part of such an organization, and left! The whole club looked at me... the Pres. asked me how I felt. I told him that some things seemed quite irregular, and arbitrary. He assured me that "this a family-oriented" group and asked why I didn't bring my WF to the next meeting...hmmmm.

My WF (KB6VUZ) attended just exactly ONE dinner meeting, on the way home she told me that this was the most absurd collection of ego-maniacs she had ever seen and refused to ever associate with them again or to use the repeater! Apparently the other women in the club didn't approve of her wearing leather motorcycle pants in public, in front of their children!

The next issue of the Club newsletter had an editorial in it that I took issue with. The writer (we never did find out who actually wrote it) was telling the readers that: "..if you hear a QSO in progress that YOU DON'T LIKE, if the people are discussing topics that you wouldn't want your children to hear about, or if you think that the language being used is not proper or if they are telling jokes that are in poor taste, key up ID and remind them that this repeater is dedicated to FAMILY RADIO!.." on and on with a final option to call so-and-so and have the machine taken off the air. Well, ok..I mean if a QSO were advocating something illegal, or suchlike..what I didn't know at the time of reading was how literally some of the regular members were going to take this advice!

In the days that followed I was reminded about FAMILY RADIO, by a good 1/3 of the regular members..."We don't want to listen about OSCAR!" - "You guys with those computers are such a drag!" - "You're not supposed to talk about that! <cars, motorcycles, parties, girls/guys, surfing, the 60's, the War on Drugs, etc> I asked one of the regs what she thought was a proper topic for FAMILY RADIO...she wasn't sure...I asked her how all these families came to be...she shrieked and went QRT adding that I was some kind of a nut.

Finally, I went to a last meeting...my WF was right, my friend was right. This was the most pedantic and perverse collection of non-technical wierdos I'd ever meet! I asked the President if PART 97 applied to FAMILY RADIO, he just shrugged and said: "Do you expect us to sponsor you or not?". I stood up and said: "Don't bother, OM, I just hope you're ready to lose your ARRL affilation!". He laughed. I left. Six months later the Club folded, and then started over..I'm in the process of challenging their bid for another 220 pair on the basis of what happened.

ARC's?? Great idea...discrimination? YOU BET! And there's damn little to be done about it! The 220 organization I belong to now is a very liberal and reasonable confederation of folks, no regulars vs. associates, no votes - one guy is our repeater trustee - it's $100/yr and no one snivels about the topics so long as Part 97 is being adhered to..and we all can use the autopatch.

FAMILY RADIO - what a joke!

+
+"Latch to flap" is the term used around here for the type of operation
+by people who seemingly have locking switches on their keying line -
+once they begin transmitting, they announce their whole medical history
+before unkeying, except for brief periods to 'reset the repeater'. That's
+directly opposed to push-to-talk one-thought-per-transmission modes of
+operation that are still common on private systems.
+
I kid people about this, reminding them that if they keep it up I'll give them a PUSH-TO-LISTEN-SWITCH type microphone so their thumb won't get so tired! ;-)

+ As more of the old farts came up from 80 meters,
+the type of operation they were used to there came with them.

This is the explaination that seems to fit, some of those guys on 75/80 AM..

..jeezz they're long winded! My 1970 ARRL handbook reminds people that the "old monopoly-switch routine, where the operator gabs to himself for five minutes at a time will get him invited off a busy VHF-FM repeater!" yup!

("The alligator got ya!" ;-))

I built the twin-lead J-Pole.

$11 built two of them, with twinlead left over. (The coax feeders were higher cost than the twinlead. :-)   It took about 15 minutes to knock out the first one, and ten minute to do the second.

I live in a no-antenna apartment. The manager states that we obviously have no hams in the building, since she is able to watch TV. I decline to discuss the subject with her further at this time :-)

I threw the twinlead J-pole out the window and keyed up. The reflected power barely moves the needle.

Thanks for the posting on how to build it. It's solved my antenna problem.

QST DE W1AW
PROPAGATION FORECAST BULLETIN 43 ARLP043
FROM ED TILTON, W1HDQ WETHERSFIELD CT
OCTOBER 22, 1990
RELAYED BY KB8NW/OBS & BARF-80 BBS
TO ALL RADIO AMATEURS

THE SOLAR FLUX TREND WAS MOSTLY UPWARD THROUGH THE FIRST HALF OF OCTOBER. ON THE 15TH THE FLUX REACHED 232, ITS HIGHEST SINCE LATE IN AUGUST. DURING THE PAST WEEK THE FLUX HAS CONTINUED ITS ERRATIC COURSE. ON THE 18TH IT WAS DOWN TO 195. THE NEXT DAY SAW IT BACK TO 221. ON THE 20TH IT DROPPED 24 UNITS TO 187.

ON THE AFTERNOON OF THE 20TH WEATHER CONDITIONS WERE FAIRLY GOOD FOR SUN VIEWING, BUT THE SOLAR DISC WAS NOT AN ENCOURAGING SIGHT. SEVERAL SMALL GROUPS WERE VISIBLE, BUT THE OVERALL IMPRESSION WAS THAT THE FLUX MAY GO DOWN BEFORE IT TURNS UPWARD AGAIN.

FLUX LEVELS HAVE NOT BEEN TOO BAD. THEY WERE CONSIDERABLY BETTER THAN IN SEPTEMBER WHEN THE HIGH WAS ONLY 206, AND THE AVERAGE WAS CONSIDERABLY LOWER THAN OCTOBER'S IS LIKELY TO BE.

WHATEVER HAPPENS ON THE SUN IN NOVEMBER, TRADITIONALLY A GOOD MONTH ON THE HIGHER FREQUENCIES, IT IS LIKELY TO BE THE BEST WE WILL SEE ON 28 AND 50 MHZ FOR QUITE SOME TIME.

AMERICAN SUNSPOT NUMBERS FOR OCTOBER 11 THROUGH 17 WERE 156, 170, 176, 190, 204, 169 AND 160 RESPECTIVELY, WITH A MEAN FIGURE OF 175. SOLAR FLUX NUMBERS AS REPORTED BY WWV FOR THE SAME TIME PERIOD WERE 202, 200, 207, 220, 232, 226 AND 193, WITH A MEAN FIGURE OF 211.4.

> in both RF and DC.

Apparently the important factor is that all "grounds" that are pertinent to your shack's operation be at zero potential with respect to each other. There was an interesting article in Beam magazine about lightning protection that mentioned "step" voltage difference. This is the difference in potential between tower ground and house utility ground if they are in different locations.

I guess it was the arrogance that comes from being in a country that has FULL use of 3 different prefix letters (K,N,W) for callsigns and forgetting that we, as well as other countries, may have to share prefix letters (like A).

[heres what I got a few months back]

From: cbmvax!vortex.com!lauren (Lauren Weinstein)

The base side is:

894-896Mhz, .006 spacing, SSB

Plane side is:

849-851Mhz, .006 spacing, SSB

These are officially considered to be "experimental, temporary" allocations.

Bob Carpenter's computation of how much microwave spectrum would be needed to support various amateur modes reminds me of the old joke about the civil engineer who was given the job of designing a bridge across a river. His first order of business was to determine how many lanes of traffic the bridge should have. Not having any better source of information, he sat down on the river bank one afternoon, counted the number of people who swam across the river per hour, tripled that figure (like all good engineers he believed in conservative design rules) and sized the bridge appropriately.

Seriously, simple extrapolations can often get you into trouble. If the history of communications has shown anything, it is that people are very clever at coming up with new uses for communications facilities that were never thought of by the original network designers. We now have a telephone network that was originally designed specifically for voice. Nobody ever thought that we'd now be using it for fax, computer data, slow scan video, pocket pagers and so forth.

What we really need on the amateur microwave bands is an enabling technology. I believe that high speed digital modems like those N6GN et al are developing are that enabling technology. Any form of information can be represented in digital form, and the economics of the technology areq such that going digital is the only practical way that we could handle large amounts of information (particularly information multiplexed from many sources) in a microwave-based amateur radio network.

Someone asked about packet on around 6MHz; well in Europe there are a number of pirate users who hang around 6.6 to 6.7MHz using modified ham gear to work SSB, theres also some number of them doing this on packet. They make up their callsigns; They call themselves 'International breakers' and i have heard numerous stations claiming to be in Britain, Ireland, France, Italy, and several of the Nordic countries.
These nets have been going for many years (they started off after WW2 using ex-government radios which could be bought dirt-cheap, or fished out of the remains of tanks, aircraft etc. that littered most of Western Europe at the time).

p.s. i hear that a number of Polish hams have acquired radios etc. left behind by the retreating(?) Soviet army and that some of these radios

cover the 50MHz band....
Watch this space!

The Atlanta service center for Icom is top notch. Quick friendly service and free estimates. These guys apparently haven't gotten the word that they're not supposed to fix old rigs or stock parts. Don't anybody tell them. :-)

What is a "qualifying run"? If you mean the ARRL code practice qualifying runs the answer is no. Obviously, having perfect print out of the ARRL qualifying run is no proof of code ability- it just shows your computer works ok.

However, there is one way of getting credit for the EXTRA code test. I got my extra class license without ever taking an amateur extra class code test. If you are a holder of a commercial 1st or 2nd class radiotelegraph license, then you get credit for the amateur extra. The code portion of the 2nd class radiotelegraph test consists of two separate tests (at least, it used to):

1. Copy plain text, including punctuation , . / ; " ( ) @ - = at 25 wpm for one minute without error.

2. Copy 5 letter/number/puncutation code groups at 25 wpm for one minute without error.

This test if only administered by the FCC at an FCC field office by appointment only.

Believe me, its much easier passing the amateur extra at a hamfest!

         ^^^^^^ ^^^^^
To throw in my 2 cents' worth, don't forget that copper braid or strap tends
to make a better rf ground than a simple wire in most, if not all, cases.
Case in point: in our research lab at Purdue, we have a 6 kw, 6 kv DC
power supply connected to a electron-gun evaporation system. These systems
are notorious for arcing during operation, thus presenting mucho transients
(read: transient, hi-power rf) to the vacuum system chassis, power supply
chassis, mains, etc.  The installation manual specified grounding the vac
chassis to the supply, and the supply chassis to the ground rod, with
6" x .050" copper strap. Our run was about 50 feet, near their predicted
maximum allowable. That, as Paul Hogan would say, is a GROUND! :-)

|>in their language.   Should I send mine back in protest? Seriously, though,
|>isn't this archaic?

Oh good -- a new fight. I was getting sick of code wars and calling out on the cop repeater to order a pizza from an airliner.

Yes, they are pollitically incorrect in certain places. No, they are not gramattically incorrect -- you can look it up, but I suspect you knew it well before you decided to try and start a fight. Until English comes up with a good, euphonious way to handle indeterminate sex or people learn to relax (nah), it will continue to be a problem. Personally, I back the use of "they"/"their" over such awful contructions as "he/she" or the muy disgusto "heesh." I'd rather trash number than invent new words.

Receiving unauthorized programming through a modified Videocipher module is potentially unlawful, thus there is reluctance to discuss any methods in a public forum such as this.

What can be said is that the Videociopher 2000 and 2100 models 018, 019 and 032 have been widely compromised by so-called "chippers". Who alter the units' firmware to simulate authorization of multiple services. The compromise is made possible by an extremely poor and short-sighted design of the DES key manangement by MA/Com, the original designers of the system.

There have been significant changes incorporated in the newer Videocipher Plus which are claimed to prevent chippers from attacking with current stategies. Digicipher, reported to be compatible with HDTV, is in the works.

Yes, there is a 900 number which reads numbers to you in hexadecimal format. There is no explanation of what the numbers are for or what to do with the numbers. I don't think it would be a very smart idea to call that number from your own home unless you want the FBI knocking on your door next month.

There are many sources of so-called Videocipher "repair" software. The best way to find out is to get a copy of a magazine called "Satellite Watch Newsletter" and read the ads (it is virtually 100% ads). It's easy to get taken. I doubt that anybody is going to be

stupid enough to go the the postal inspector complaining that he/she was ripped-off buying illegal Videocipher firmare, but only recieved a box of a few scraps of wire and some old TTL chips.
Caviat emptor.

I have a 90 Jeep Wrangler and I cannot use the 30meter band because there is a 10Mhz computer chip (i guess) somewhere in the beast and whenever I xmit (even qrp) the motor turns off.

I suppose it is a good anti theft device, just turn on the sterio and set up the HF rig for VOX. If you start the jeep with the sterio on it will key the vox, transmit on 30meters and turn the jeep off (but how would I ID the xmitter :-))

I have modified my FT470 to TX and RX from 430 to 450

and from 140 to 174.

I don't remember exactly but it was a simple matter of removing a jumper.

I got the info in this net and could probabily find it if you need it.

The Yaesu FT470 has 4 different versions according to the owner's manual. Versions B, C, and H cover 430 - 440 MHz (I assume these are European versions). The Version A tranceiver covers 430-450 MHz.

On a recent trip to Norway, I was able to use my HT (un-modified) to transmit on 434.7 minus with no troubles.

#if !OLD_PHART

Actually the calibrating and tunning signal for RTTY is RY ....
seems that with this combination you have alternating 1's and 0's.
Makes tunning the signal on the old CRT crossed display very easy.
When properly tunned you get a + instead of a X.

Before you leap to your ASCII chart and check it out, remember RTTY
uses the Badout code which is 5 level

>

And dube@cpdvax.csc.ti.com returns:
>
>Say what?? How come Derek can use the 20 wpm CSCE for 5 or 13, but can't use a 25 wpm CSCE (or higher) for 20?
>Does honor run out somewhere between the 20 CSCE and the 25 CSCE? Or is it interpreted differently for a G# than it is for an AA#?
>

There is a little confusion here.

Your original question asked why you couldn't use a *qualifying run certificate* to prove competency with the code. Derek pointed out that the *qualifying run certificate* is given by the ARRL for copying code at home, and then he referred to a CSCE which is a Certificate of Sucessful Competion of **Examination.** A CSCE is given out by VEs at VE exams for passing a VE exam. Derek took the 1c test and passed at 20 wmp; therefore he didn't need to prove proficiency at 5 wmp or 13 wmp.

So, there is no issue of "honor running out" between 20 wmp and 25 wmp since the two are entirely different.

Rick N6RK writes:
> In regard to wide-band gain blocks (e.g. Mini-circuits MAR-_ series), I would suggest substituting the Motorola MWA-0204 or the Avantek MSA-0_04 series. The disadvantage of the MAR- series is that they are very easily damaged if over driven. The damage level is so low that you can burn one out by driving it with the output of another copy of the same model! On the other hand, I have *never* burned out a Motorola or Avantek unit, despite numerous accidents.

>

Interesting... Particularly so as far as I know it is Avantek that actually builds *all* the MiniCircuits MAR devices! I think the suffixes are only due to the different packages...

04 is 4-pac plastic
20 is 200 mil Beo
35 is micro-X
70 is 70 mil hermetic
85 is 85 mil plastic

the 04 is only shown to be available as the MSA-0104,MSA-0204,MSA-0304,MSA-0404 in my (1987!) Avantek catalog. The MSA-06xx is a particularly useful device because of its stability and lower noise figure. The MSA-08xx can be lower noise and higher gain but is only conditionally stable. In fact, my fairly careful measurements in a well characterized fixture with accurate deembedding show it to be somewhat *less* stable than the published specifications indicate. It is useful too but extra care has to be taken. As far as I know the MAR-6 *is* an MSA-0685.

BTW, the white dot (chamfered end) is the *input* lead on this part.

I have never yet blown a MSA/MAR series part out by overdrive. I *have* broken a whole lot of leads off at the package though!

In article <38680@ut-emx.uucp>, oo7@ut-emx.uucp (Derek Wills) writes...
>

>Speaking of certificates, anyone want to discuss why the WAZ and several other certificates refer to the awardee as male only? All my WAZs (how immodest) say "HE is authorized to include the letters WAZ ..... originating from HIS station". Any female ops out there with a WAZ? Do they cross out the "his" and put "her"? Does anyone find it insulting? (and if not, would you think it strange for a male op to have a certificate attesting to "her" performance?). ...

To be pedantic, Derek, they are correct and inclusive.

English has given up most use of gender in nouns, unlike many other languages which categorize essentially all _words_ (not _things_) by gender. Note that gender is a characteristic of a WORD, not a THING, so two synonyms can have different gender. (Also note that people do NOT have gender; they have sex. Using "gender" to refer to people is a poor euphemism. E.g., we can not have a gender-neutral personnel policy, but we can have a sex-neutral one.)

The few remnants of gender in English are for personal pronouns, where gender refers to sex. Due to the way the language evolved, we ended up with "masculine" pronouns and "feminine" pronouns. The latter apply only to female persons. The former apply to both the "masculine gender" (male persons reference) and the "common gender" (no sex implied).

Thus it is correct to say that if your secretary is good, he won't misplace your mail. It is wrong to say "she won't", unless you're referring to a particular female secretary, since secretaries _can_ be male, so common gender applies. Ditto for telephone operators & nurses (not wet-nurses, though). And on the flip side, it's right to say "He" on a DX award that can go to a person of either sex.

The college I attended was all-female before 1971, except for 1946-51, when it took male war veterans. But it had an _alumni_ (male and common) association, not _alumnae_, since it was not _exclusively_ female. Alas, we poor menfolks don't even have a pronoun referring to us exclusively!

Now back to the other flame wars already in progress.

Sounds great! But you sure pay for that extra power - they are very
expensive, both under the Kenpro name and the re-packaged Yaesu model.
Has anybody gone shopping for these combo rotators lately - it seems
like the prices are pretty much the same everywhere, but I haven't looked
more than a few places.

I'm wondering, also, if you can have a few hundred feet of control cable
before the meters become inaccurate.

There was a nice (long) paper in the most recent ARRL/CRRL networking
conference proceedings(pp 25-72) by Dan Doberstein describing construction
as well as a good deal of GPS fundamentals. For anyone interested in
building a GPS receiver I think this would be very informative. The author
clearly spent a lot of time at it. I'm not sure how it ended up in
that particular proceeding but its a nice paper.

All right, let's go back to the beginning on this one. "CSCE" stands for Certificate for Successful Completion of an Examination. It's what the VE gives you when you pass any license examination element, and it can be used to satisfy any element requirement needed for a license or a license upgrade for a period of up to one year from the date it was issued. What Derek was telling you, and you obviously couldn't copy even as ASCII text, was that he didn't even need to bother himself with the 5 and 13 wpm tests. He passed the 20 wpm test off the bat, and then used the CSCE for that element as he worked his way through the written elements. Believe it or not, you could even do the same with your N5 prefix!!

I think this is a receiver, not a transceiver. Isn't this the old
WWII vintage "Hammarlund Super-Pro" ??

You can get a manual for this and a lot of other old gear from:

Hi Manuals
P.O. Box 802
Council Bluffs, IA 51502

Send them a money order for $2.00, and they will send you a catalog of
their manuals for old gear.

>I'm not being obnoxious, just confused,  . .  did you mean 'suffix', the
>whole prefix/suffix thing in the US baffles me [etc]
------------------------------
```

Yes, I thought of that e'en as I penned my missive. I think of the prefix of a call being the bit that usually goes in front and tells you which country/reef/rock the signal is from. Thus KH6 is the prefix for Hawaii, whether it occurs as KH6XX or as K7SS/KH6. The suffixes in those cases are XX and SS, even if SS does come in the middle :-)

The WPX (Worked Prefixes) awards and contests use prefix in this sense too, that's what I had in mind. Whether K1RH/1M7 should be signing that way or 1M7/K1RH I really don't know or mind too much. I've heard stations in West Virginia signing with their own call /WVA. In some countries you append your own call to a club call - there's a VU station on the air sometimes signing /LID, because it's being operated by VU2LID (I'm not making this up, although I've often thought it would be nice if you could append things like that to the calls of people you work sometimes, I thought of adding /QRP each time I work a particular contester rumored to run molto KW in contests).

Anyway, on the other points, yes, if you live in Texas and use a reciprocal call you sign W5/call. I guess the idea is that if you sign BY1XX/W5, you get listeners' adrenalin flowing early, and it's an anticlimax when they get to the W5 bit. When you hear the call with W5 in front, you keep on tuning past the second you hear the W - that may not be what the FCC had in mind, but it works for me!

The other night I was listening to Radio NY International (7520Mhz). They sounded like a pirate station except it turns out they were being broadcast by some other station that seems to be legal. They apparently used to be a real pirate station operating off the east coast on a ship. Does anyone know anything about them. They were very entertaining and I'd like to know their schedule as well as their story.

Thanks,

Jon

Now I am confused. If K1WHATEVER/1M7 is Martha's Vineyard, pray tell what is the 1M7 suppose to stand for? Once Mobile Seventimes? Or is this just a catchy sign to snag the WFWL crowd and generate a pile-up? Which now brings up the question on 1J5. Is there some IOTA or other group that generates these /SUFFIX designations? Life use to be simple until a XM7 became British Columbia, OM is OKland, and all the other neat calls. Now let see where did I put the ITU allocation list ....

Yes, but they must pay another fee. ($4.95 or whatever it is at the time.)

> Suppose I have gone over the questions the examinee missed, and the
> same questions just happen to pop up on the next exam I give moments later?

They should not be given exactly the same test. There should not be any of the questions exactly the same on another test. [That's why there are about 10 times the number of questions in the pool as on the test!]

I don't know about other teams and VECs, but our VE team has exam sets consisting of several exams for each element. Every applicant that comes through our group has an index card with the date, which exam element and serial number, and the result (Pass or Fail only). If someone wants to take an exam element (code or written) we check (1) if they have a card in our file, (2) which, if any, of those exams desired they've seen before.

If someone comes in who's been with us before, we check and give them a different exam for the element they want. We actually do check, and keep records. That's the best, I think, that we can do, and I think also in most situations, it works. There's always an exception.

> How can I, as a conscientious VE, adhere to the intent of the rules in a

> netters (and flamer-throwers, too)?

OK here's a scenario. Many VE teams in the Dallas area are W5YI-VEC sponsored. The VEC provides test kits (several exams, appropriate keys, and stuff) to the VE teams.

An individual *-could-* go to VE Team X in the morning, attempt and fail exam 3A-#Z90 (a fictitious number) then go to the next suburb, to where VE Team Y is giving exams that afternoon and get the same exam. VE Team X and Y do not exchange records because the problem is not one that is worth the effort.

FCC Rules part 97.205 paragraph E sentence #2
(e) ..."Limiting the use of a repeater to only certain user stations is permissible."

Self explanatory.

>But if I find my way into the repeater anyway, then it is effectively
>NOT CLOSED for me. The INTENT on the part of the operator to not allow
>me to use it is what the issue is about.

If the front panel switch was turned off on the repeater, and you drove up the hill and turned it on, you would have also made the system "NOT CLOSED" for you... His intent there is that the repeater not be used also by you, or in this case anyone else. If your definition of a CLOSED system is one that is physically impenetrable, okay. But usually it means a repeater that has use limited to certain users. And you have not become one of these designated users by figuring out the repeater PL, Touch Tone, digital squelch or whatever system implemented to hinder unauthorized use.

>If the OUTPUT frequency is already in use, the repeater should NOT
>transmit on that frequency. It may be in use from any of a variety
>of reasons. The band plans and coordinations, however, point out
>specific accepted frequencies for many types of operations. Some,
>however, are not mentioned in the bandplans, and any frequency is
>fair game.

Agreed. And if a repeater is operating out of coordinated band plans, it must accept the consequences. And people operating in the repeater sub-bands, say simplex on a coordinated repeater output, also must accept that a repeater may key up on top of them.

>All "clique repeaters" should move to 23cm.

Or all those who are dissatisfied with what's on 70cm, move to 23cm...

Yes. When I moved to CA from OH, I worked the 20 meter CW county hunters' net the whole way out, running 100W through a tuner into a 10-foot CB whip. Keeping a logbook can get a little hairy at 55 mph on the freeway, but the actual operating was a snap. I had the keyer paddle strapped in just to the front of the passenger's seat where it was comfortable to reach. If traffic required my immediate attention, I could "retrieve" my hand much faster than if it were holding a microphone.

In exam sessions where I have been a VE, we routinely double-check all missed questions for examinees who fail by only 1 or 2 questions.

Occasionally we do find a typo in an answer key or a question rendered invalid by changes in the regulations.

context: closed ham repeaters

In article <30500824@ux1.cso.uiuc.edu> phil@ux1.cso.uiuc.edu writes:
>...If you want the law to protect your equipment from my use, put it
>on a part of the spectrum where the law has such provisions.

Doesn't do any good! The commercial-band UHF repeater where I work (Indiana University) has been plagued by bootleggers with programmable radios, including "cable gypsies" (itenerant installers of CATV and other utility lines). They move into an area, get on common repeater freqs, try different CTCSS ("PL") codes until they get a repeater to work, then disregard its licensed users. FCC won't expend the effort to catch them.

They claim they have a license for our frequency (they do, but not in this area), and they move all over the state using four different licensed frequencies and whosever repeaters are in range. (Who needs ham radio?)

We could have a major "fox hunt" with attendant legal hassles (they have threatened bodily harm to us! Maybe we should take the football team along! %-) The practical solution is digital squelch with thousands of combinations, but management is too cheap to buy it.

Got some on-air advice this morning that I'd like to check out. I own a Kenwood TS-440S. One of its meter switch positions is for ALC (which, in typical fashion, isn't even defined in the 440 manual. You have to read the 940 manual to find out that it stands for Automatic Limit Control.). They say, "don't let even the peaks of your SSB output go past the end of the red zone." The guys on-air said, "The meter needle shouldn't move at all. If it does you're going to splatter."

The best I can figure out is that they're both right. The only thing I can think of is that the meter needle indicates, by moving away from zero, that the transmitter is limiting your peaks to prevent overmodulation, and that if you go past the end of the marked zone, you've exceeded the transmitter's ability to compensate, and will start splattering at that point, but not before.

If anyone knows the straight poop on this, I'd appreciate hearing about it. Going off the air for twenty years and then coming back as a "lid" is just what I need.

The local National Weather Service station on 162.55 MHz holds the callsign KIH035. Other NWS stations I have heard use similar callsigns.

Back in the days when you actually had to obtain an FCC license to run
a CB radio, CBers had callsigns that were of this form. For example,
one was KLQ0863. Since they eliminated CB licensing provisions
entirely, presumably they could reassign the namespace.

Grammatically "right," perhaps, but not inoffensive.

True, we need a good solution to this problem. And as Patrick pointed
out, we don't have an entirely satisfactory one yet.

But in the interim, many documents can be written without using the
third-person singular. I have DXCC, WAC, and WAS certificates on my
wall that prove it's entirely possible--without sounding convoluted.

I'm sure the WAZ folks could come up with acceptable rewording if
they cared. Apparently they don't. (Or at least haven't so far.)

I am looking to get ahold of a speech processor for a Drake TR-4. Does
anyone know of any company currently in existence that manufacturers such a
beast? Failing that, does anyone have a used processor they would like to
sell? Thanks for any info!

Yep:  W2CXM, the Cornell Amateur Radio Club (Ithaca, NY):

     W2CXM, Cornell ARC
     401 Barton Hall
     Ithaca, NY  14853

HF (TS-440), 2m, 220, as of this time last year.  Also packet:  W2CXM-1 on
145.01, I believe; you can reach it through the NEDA net.

**** UoSAT-OSCAR-11 BULLETIN   24 October 1990 ****

UoSAT MISSION CONTROL CENTRE
University of Surrey, Guildford, Surrey, GU2 5XH, England

** AO-13

Command Stations performed magnetorquing procedures near perigee of orbits on October 15-17. The new transponder schedule is as follows:

```
Mode-B : MA 000 to 095
Mode-JL: MA 095 to 125
Mode-LS: MA 125 to 130
Mode-S : MA 130 to 135
Mode-BS: MA 135 to 140
Mode-B : MA 140 to 256
Omnis  : MA 220 to 040
```

This schedule is expected to continue to 261290. The spacecraft attitude is:

BLON = 180 and BLAT = 0

** AO-10

AMSAT-OSCAR-10 appears NOT TO have been receiving sufficient solar panel illumination to support Mode-B transponder operations. Both beacon and transponder signals show signs of FMing. Until further notice please DO NOT use AO-10's transponder. AO-10 may be able to to support Mode-B transponder operation in November.

** AO-16 PACSAT

The microsat BBS has been tested on the ground engineering unit, and is now ready for uploading to AO-16. The satellite BBS software was written by Jeff Ward, G0/K8KA, at UoSAT and was ported to the microsats by NK6K. The porting was easily achieved, as there are only 10 lines of code that are different between the UoSAT version and the Microsat version. A lot of effort went into the design of the BBS, operating system, and other support code to make that possible. Once complete, the following elements will be available:

256k file system:

This is just half of one of the four available banks of bank switched memory. The more complete file system using all four banks and the 6MB mass memory will be uploaded after more testing.

FTL0 file server:

This implements the protocol described in the FTL0 document, available on CIS, the 9th ARRL Networking Conference proceedings, and elsewhere. It allows file uploading, downloading, and a simple directory display. It requires the use of software at the groundstation: a simple version, called "PG" has been written by Jeff and will be on CIS soon.

Broadcast server:

This implements the broadcast protocol as described along with FTL0 and has been running for several weeks on UO-14, and a few people have rolled their own receive program, at least one written in BASIC. A simple version, called "KISSUI" has been written by Jeff and will be on CIS soon.

After this is loaded, the following separate programs will be running on AO-16:

```
Kernel - Operating system - NK6K/Quadron
AX25   - AX25 driver - NK6K/WB6YMH/Quadron, pd on a KA9Q AX25 implementation.
PHT    - Spacecraft control, power management & program loader - N4HY/NK6K
AARTD  - AART driver - NK6K/WB6YMH
MFILE  - File system - G0/K8KA/UoSAT
FTL0   - File upload/download - G0/K8KA/UoSAT
PBP    - File broadcaster - G0/K8KA/UoSAT
```

** $BID **
Please use BID $UOSAT.1024 for PR BBS use.

>what about the opportunity to serve as a volunteer examiner?

OK, I forgot about that one. Do we need any more VE's?

>and what sort of guarantee do you have of getting a ``nice''
>callsign? you may get a shorter but really awful one.

Well, shorter is nicer. I would like to get one where people are
NOT ribbing me for working for a radio station in Chicago :-)

You can get bad call in any group. If you get a good call in one
then you may be wise to stick with it. I really don't care for
an N9xxx call, so maybe, just maybe, I'll go with an advanced call
as there seem to be plenty left. I will have to hurry or else end
up waiting for a while:

> >   9   WV9Q   KE9ZF   N9KDV   KB9FNS

since to me, KF9xx is OK, K[GH]9xx is not, and KI9xx is fine, too.
Actually I think I might like KI9xx better so there is yet another
reason to "put it off" :-)

Once I get my neato advanced call, then I can upgrade to Extra, not
check the little box for a call change, and become YET ANOTHER VE :-)

Regarding the scheduling of the STS-35 SAREX QSOs:

At the AMSAT annual meeting in Houston last weekend, Ron Parise (WA4SIR) explained in detail the reasons behind the choice of orbit for STS-35 and the timing of the SAREX QSOs. What follows is from memory, but I believe it to be accurate...

The payload capacity of the shuttle depends on the inclination of the orbit. Maximum capacity coincides with a due-east launch; since Cape Canaveral is at 28.5 degrees N longitude, this produces a 28.5 degree inclination orbit. Since there was no primary payload (ASTRO-1) requirement for a higher inclination, 28.5 degrees was chosen.

The orbital altitude is a tradeoff between "shuttle glow" (at lower altitudes) and free electron density (at higher altitudes). Shuttle glow occurs when the shuttle passes through and ionizes the rarified atmosphere at high altitudes; much of it is in the ultraviolet, and this generates an undesired background for the ultraviolet telescopes. Hence you want to go to a higher altitude. On the other hand, going higher (at the altitudes in question) results in a higher free electron flux, and this can interfere with the more radiation sensitive instruments on board. As a compromise, an altitude of 190 nautical miles (350 km) was chosen. [There's another consideration: the higher you go, the lower the shuttle's payload capacity. Ron didn't mention this one, so I assume it wasn't an important consideration.]

The time of launch (late night) was chosen such that passes over the South Atlantic Anomaly would occur in daylight. (The South Atlantic Anomaly is a region where the earth's radiation belts come unusually close to the surface as a consequence of the offset position of the earth's magnetic field). The trapped-particle radiation in the Anomaly cause upsets in the detectors, and it was felt that it would be better to have these occur during the daylight passes when observing would already be restricted by the presence of the sun (some observing can occur on the day side, but the telescopes must stay more than 45 degrees away from the sun). Night side passes will therefore yield prime viewing, uncontaminated either by sunlight or passage through the South Atlantic Anomaly.

The specific time of launch was chosen as the earliest time that there would be daylight at the trans-Atlantic abort sites in western Africa.

The time for Ron's in-person QSOs is restricted to the two hours before and the two hours after his 8-hour sleep periods. Since these have already been planned out well in advance, he has been able to determine where the shuttle will be during these intervals. Unfortunately, it won't be near the continental US. That's the reason for the inability to schedule real-time QSOs with schools (or other sites) in the US. The packet robot may be active during these times.

There's one more complication. The Astro-1 mission is a long one, and hydrogen and oxygen supplies for the fuel cells will be marginal. The SAREX payload was therefore a somewhat unwelcome addition to the shuttle's electrical loads. So it may not operate full time - even the packet robot may not be operating at certain times.

I suspect that more info may appear in upcoming AMSAT bulletins.

Phil

In article <425@ssc.UUCP>, tad@ssc.UUCP (Tad Cook) quotes K1ZZ:
|> The number of new licensees will exceed 26,000, a substantial

|> increase over the previous year. [...]
|>   Despite these figures, we're probably going to hear the
|> 'Amateur Radio is dying' refrain from some quarters. It will be
|> interesting to watch how the gloom-and-doom folks explain them
|> away."

The November 1990 QST (just arrived) lists 110 Silent Keys with US
callsigns. This appears to have been a slow-to-average month for that
column, but if you extrapolate that to the whole year, that's a
minimum of 1320 US hams dying each year. So that's a net growth in
1990 of not more than 24,680 amateurs. But more importantly, we have
no way of knowing how many other licenses would have expired in 1990
if it weren't for the change to 10-year license terms a few years
back. Nevertheless, even if you ignore that factor the annual growth
rate is no more than about 5%, a heckuva lot lower than the growth rate
in, say, cellular telephones.

Why, I even get a better rate of return than that on CDs at the
local bank... :-)

The Silent Keys column of QST should not be taken as a reliable indicator of the rate of mortality amongst amateur radio operators in general. No doubt MANY licensees expire without notice to the ARRL.

VVV is often sent as an 'idle' message when a link is not being used to handle traffic. Coast stations that still use CW frequently send their callsign too; 'VVV de DHJ' for example.
Stations like this are a great way to pick up the code, as they repeat the same pattern for ages (so you get the rhythm of the letters).

RYRYRYRY is the RTTY test signal; worst combination of 0's and 1's for a mechanical Teletype(c) to reproduce; it was once possible to get a 'Telegraph distortion measuring set' that displayed a helical timebase with bright dots to represent the start & end of each element; you had to fiddle with the mechanics of the TTY to get all the dots lined up vertically on successive turns of the helix.... RYRY gives a nice cross on the old CRT-type tuning scopes. Unfortunately, such things have become largely obsolete, like the tuning-forks, spring tension-gages, feelers (and grease/oil!) that were needed to maintain the mechanical TTYs.
These TTY-maintenance toolkits were often beautifully presented in felt-lined inlaid hardwood cases... ITT-Creed, Teletype corp. etc. charged plenty for them too.
Another test often sent by CW operators (and many of the 'mechanical-CW' machines on the commercial bands) is just a single letter ('C' seems popular) repeated over and over.

SB SPACE @ ALLBBS < KD2BD $SPC1029
* SpaceNews 29-Oct-90 *

Bulletin ID: $SPC1029

SpaceNews

MONDAY OCTOBER 29, 1990

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States.
It is published every week and is made available for unlimited distribution.

* DOVE NEWS *

The following message from N4HY was recently carried on DOVE-1/OSCAR-17:

DOVE-1>BRAMST <UI>:
The new file system will be loaded to PACSAT and BBS operations will commence in the next couple of days. Upon testing file system there, DOVE will be reloaded. This will occur next week. 73 de BM Oct. 18

* PACSAT NEWS *

The MicroSAT BBS has been tested on the ground engineering unit, and is now ready for uploading to AO-16. The satellite BBS software was written by Jeff Ward, G0/K8KA, at UoSAT and was ported to the microsats by NK6K. The porting was easily achieved, as there are only 10 lines of code that are different between the UoSAT version and the Microsat version. A lot of effort went into the design of the BBS, operating system, and other support code to make that possible. Once complete, the following elements will be available:

256k file system:

This is just half of one of the four available banks of bank switched memory. The more complete file system using all four banks and the 6MB mass memory will be uploaded after more testing.

FTL0 file server:

This implements the protocol described in the FTL0 document, available on CIS, the 9th ARRL Networking Conference proceedings, and elsewhere. It allows file uploading, downloading, and a simple directory display. It requires the use of software at the groundstation: a simple version, called "PG" has been written by Jeff and will be on CIS soon.

Broadcast server:

This implements the broadcast protocol as described along with FTL0 and has been running for several weeks on UO-14, and a few people have rolled their own receive program, at least one written in BASIC. A simple version, called "KISSUI" has been written by Jeff and will be on CIS soon.

After this is loaded, the following separate programs will be running on AO-16:

Kernel - Operating system - NK6K/Quadron
AX25 - AX25 driver - NK6K/WB6YMH/Quadron, pd on a KA9Q AX25 implementation.
PHT - Spacecraft control, power management & program loader - N4HY/NK6K
AARTD - AART driver - NK6K/WB6YMH
MFILE - File system - G0/K8KA/UoSAT
FTL0 - File upload/download - G0/K8KA/UoSAT
PBP - File broadcaster - G0/K8KA/UoSAT

[Story via OSCAR-11]

* OSCAR-13 NEWS *

Command Stations performed magnetorquing procedures near perigee of orbits on October 15-17. The new transponder schedule is as follows:

Mode-B : MA 000 to 095
Mode-JL: MA 095 to 125
Mode-LS: MA 125 to 130

Mode-S : MA 130 to 135
Mode-BS: MA 135 to 140
Mode-B : MA 140 to 256
Omnis : MA 220 to 040

This schedule is expected to continue throu 26-Dec-90. The spacecraft attitude is BLON = 180 and BLAT = 0.

* TNX QSL! *

A special thanks to all those who sent QSLs, cards and letters to SpaceNews:

NL7LL : Gary Freitag, Ketchikan, Alaska, U.S.A.
VE2HLT: Claude Pare', Sherbrooke, Quebec, Canada
4X4LF : Shlomo Goldstein, Negev, Israel

...and packet radio messages:

RTTY DX Notes 1of3 10/26/90

RTTY DX Notes for week ending 26th October 1990
BID: $RTDX1026
Part 1 of 3.

Looking at the reports being received, indications are that the higher bands (21 and 28 MHz) are showing greater activity of late. Maybe it behoves us to pay more attention to these bands at the present, and in the future, it could prove interesting for the good DX.

Our thanks this week go to I5FLN and cluster, JA1BLV, OD5NG, TG9VT, UT5RP, VE3OCX, VK2EG, W6/G0AZT, W2JGR and the Tri-State DX Packet Cluster Network. Thank you all for your information. Unfortunately I could not use it all, but I hope that I have given you the best of it.

SB RTTYDX @ ALLBBS $RTDX1026B
RTTY DX Notes 3of3  10/26/90

RTTY DX Notes for week ending 26th October 1990
BID: $RTDX1026B
Part 3 of 3.

QSL Information:

All cards for UA3TT/whatever go to Box 18, Gorky 603000, USSR.

Z21GU says to QSL via callbook address.

FW1FM will QSL via Box 20, Futuna Island.

9J2BO QSL manager is W6ORD.

ZD7JAM and the scouts will QSL via Box 54, St Helena Island.

3DA0BW and 3DA0BX will QSL via Box 57, Big Bend, Swaziland.

RA2FB indicates that Box 261, Sovetsk, 238700 USSR is his QSL address.

CY9CF says to QSL via Box 4204, F-97500, St Pierre Et Miquelion Island
via Canada.
```

Notes Of Interest:

OH2BGD reports that he will be QRV from PJ9W after the CQWW Contest. He will operate RTTY on 28, 21 and 14 MHz, usual frequencies.

HK0TU should show up around 3rd November all bands 1.8 to 28 MHz, QSL via HK3DDD.

ZK3KY says that she will operate from T33 (Banaba), maybe this week. Also OH2BH will operate from Banaba with the call of T33T from 7th November to 21st November. QSL to OH3GZ.

CE0ZZZ is still expected mid November according to F2JD, who will be the operator.

ZD7JAM and 5B4LSG/J were Jamboree stations, but they still count as new countries.

And now for the Rumor Department. WA4JQS has been quoted as saying that the VP8SSI and VP8SGI DXpedition has been postponed, because of the Middle East crisis and the high cost of fuel. Maybe they will try for somewhere else later.

Also it is believed that XU land may be activated in the foreseeable future. Keep your fingers crossed.

GL DE DX1 (VK2SG) AT TG9VT.

Written by VK2SG. Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA.
Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU.

Well, it certainly won't be CBS or the manufacturers of cellular phones who will be informing them, that's for sure!

The ECPA was a handout to the cellular industry to give them a law that they could point to and say ,"Gosh, Mr. Consumer, how can the phone be tapped, it's ILLEGAL!"

I note with interest that the Radio Shack series of scanners locks out cellular phones, but it does not lock out several other frequency ranges also off limits by the ECPA. Hmm, wonder why that is? Could it be that they make a lot of money selling cellular phones that could be affected by scanners that can receive them???

NAAAAHHHH!!!!

By the way, thanks for the E-mail responses to my inquirey about the Student Information Net. Respondents please realize that fs024 never was my account. My E-mail account is given below.

I have come across a glossy flier on an HF Magnetic loop antenna manufactured in the UK by CAP. CO Electronics.
Among the features claimed are :-

* SWR of 1.4 to 1 at the very least, 1.1 to 1 on most bands.
* doesn't require an ATU.
* occupies only 80cm to 4m of space
* bandwidth from 3kHz ro 50kHz.
* very pricey, around $600.
* ...

Being a flat-dweller and rather unsettled (I tend to change flats very frequently), it seems to be ideal for DXing, which I miss at the moment. CAP. CO claims that as compared to a beam 60 to 80 ft long, thir antenna is only 1 to 1.5 S units down on 20/15/10 metres.

Is there anyone out there who has had the (dis/)pleasure of using one of these? If so I would very much like to hear you experiences.

Tnx, 73's

Not a bad idea. When I bought my current - 1 house back in Texas,
I knew at the time I bought it that I wanted to put in a satellite
dish (cable hadn't reached there yet). So I made it a condition
of the sale that all restrictions and covenants were to be supplied,
and if there had been any antenna/dish restriction applied to the
property anywhere & anytime the sale would be void at my option.

I think this fallacy has been beat on enough times, but CW is neither
spectrally efficient nor as fault tolerant as the DSP based data modes.
Frankly, it isn't that much more efficient than SSB, and the advantage in
a Rayleigh fading environment is questionable.

It really depends on the individual repeater, but on most of the 2m machines
out here, you can find someone yacking away at just about any hour of
the day or night.

>PL/CTCSS does not consitute a closed repeater.

Only if you have a copy of the repeater directory. But frankly, I consider

PL to be good engineering practice, in any event.

Sorry - "RY" was used in the old time Teletypes (trademark). It gave
you an alternating bit sequence in the Baudot code. Note sure why
cw uses "V"? (maybe as a procedural sign ST? Send Test?)

>...but that's closing the repeater, Phil!

Either there is more than one kind of "open" (the way I think of it) or there is more than one kind of closed. I will described FOUR kinds of repeaters and let YOU label the MIDDLE two:

1. This repeater can be used by anyone. There are no access mechanisms of any kind. If you transmit on the input, the repeater will bring up its transmitter and retransmit your audio.

2. The owner(s)/operator(s) have indicated that anyone may use this repeater despite the fact that it has access control mechanisms such as CTCSS and/or DTMF. The CTCSS tone frequency and/or the DTMF access code sequence are published for anyone to obtain and are freely spoken over the repeater itself.

3. The owner(s)/operator(s) have indicated that anyone may use this repeater unless they prove to be a serious nuisance by means of poor operator practice, or operate illegally using the repeater. The access mechanisms are periodically changed at regular intervals and also when a serious violation occurs. The users are informed of the changes by other means. If DTMF access is used, it might even be the case that each user has a DIFFERENT access code.

4. The owner(s)/operator(s) discourage anyone but a limited group to use this repeater, and have in place effective access mechanism to prevent ordinary amateur radio operators from being able to achieve access to the repeater. Membership is the groups is also controlled. I am not attempting to distinguish why this repeater is this way.

Now let's label these. I have insert my *GUESS* as to what N9FZX would label them as. Please correct me if I am wrong. If there are other examples of repeater situations you believe need to be labeled, by all means mentioned them; I know there are others.

	KA9WGN	N9FZX
1.	open	open
2.	open	?
3.	open	?
4.	closed	closed

>No problem. Only, don't gripe if the "local option" promply ignores that
>suggested bandplan..

I believe that once a frequency is coordinated in terms of interference avoidance to a particular local area, the actual USE of that coordination, i.e. to whom/what it is "assigned" should be decided upon by ONLY the hams, and by ALL the hams affected, in the local area. If they decide later that this assignment should CHANGE, the wider coordinating body that determines the interference and other technical aspects of the coordination would have nothing to do with the changes (besides record them for contact purposes).

Oh come on, lighten up. Yes I see the smiley, but you're being pretty
patronizing. The man said a Morse endorsment was irrelevant to doing
RTTY with his C64 (an opinion I share). Get a grip... and moaning
about other people's spelling isn't really helping your cause. So he
can't spell; at least he can construct a rational arguement. Ad hominem
attacks are the tactic of someone who can't.

For what it's worth, I wrote (and passed, thanks be to the NetGhods)
my first Morse element yesterday afternoon. I'm not suddenly filled
with a wild desire to pound brass. I *will* do it though, so I can
pass my second Morse element. Maybe in time I will come to enjoy it.
I don't know yet. But it sure is coercion, it meets every criterion
for that label.

Yours for private choice, whatever that may be (and there's nothing
wrong with using and enjoying A1, I greatly respect it as a neat
skill *for those who want to use it*, it's just that the proficiency
requirement is arbitrary).

I am not all that familiar with the repeater system (frequency
allocations, ownership, etc.) in the U. S.

I am especially puzzled with the concept of "open" and "closed"
repeaters and how the latter fits in the picture of amateur radio. Can
someone please clarify this terminology for me?

As far as I understand it, there are a multitude of "private" repeaters. What's the point in having a dozen repeaters in a questionable QTH (and limited range) in comparison to ONE good repeater in a high (broadcast) tower or similar? Or ARE they actually all that good?

What would you say is an average working range of a typical repeater in Ohio, or any other place with flat terrain?

In here, ALL repeaters are club-owned and completely unrestricted for any user. There are currently seven (7) allocated repeater channels on 2 meters (145.600 - 145.775, 25 MHz raster) and they seem to be enough.

Am I missing something here?

Thanks,

Luru

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

In article <paul.4734@wa1omm.UUCP> paul@wa1omm.UUCP (Paul MacDonald) writes:
>
>You can copy GOES satellite photos from HF. They are retransmitted on a
>regular schedule. To receive it otherwise would entail considerable
>investment for a suitable receiver - although, you can copy it by
>connecting a TVRO receiver to an HF receiver.
>I use an AEA AVT connected to an Amiga. I get the data direct from the
>low-orbit APT satellites using a Realistic scanner on 137.xxx MHz. The
>results are excellent.

A friend and I are very interested in doing this also. A short "howto" with some very specific info would be greatly appreciated and perhaps of general interest to the readers of this group. We would recieve to IBM PC computers.

Thanks for the help! :-)

      You missed the point.  On our side of the argument, photographic
evidence of the way structures like towers and trees actually fall
down would be an excellent defense against the "from the base across
the property line" restriction.  In most cases, trees and poles and
antennae fall within the property on which they are planted, unless
pieces break off of them.

It belongs to Federal and Military services. The 3-letter, 1-number style of callsign is frequently found in aviation related stations.

CEO summary:
The way I've always seen it done (for low current needs, like RS-232) is to use a 555 and run the output through a driver transistor, then through a capacitor, so as to differentiate the square wave, giving positive and negative spikes. A diode passes the negative ones into a capacitor, which eventually builds up a negative voltage, which you can regulate with a zener, if you so desire.

Half right. The RTTY calibration signal was (is) RYRY because of the way the mechanical teleprinters operated. VVV is commonly understood to mean "test" and is used as a frequency marker. Some HF stations use CQ as a frequency marker.

> From: wb9omc@ea.ecn.purdue.edu (Duane P Mantick)
>
> *assuming* that a majority of hams intend to use it as an excuse to use those frequencies regularly. Admittedly, there may be

Not a majority of all hams, but many who have the capability do indeed use it when _they_ think it's OK. Emergency or not. On the flipside, there are a great many non-hams with modified ham equipment in regular, daily use on non-ham frequencies.

> some serious doo-doo, and deservedly so. No group as large as the US population of hams gets by without having a few bad apples.
> On the other hand, there are also some complete assholes in the Public Services area, too.

Agreed on both counts.

> Let me put it another way. I would rather risk being fined by the FCC and/or losing my ham ticket than to face a lawsuit for negligence by the persons family for having let him die by the side of the road when I could have called for help. Worse than that,

How many "civilians" are knowledgeable enough about radio to even _think_ of suing you for that? Most people who are not into radio have no concept of what radio is or does, or how many devices they use that incorporate RF technology.

On the other hand, a very large percentage of hams don't have a clue as to what goes on outside the amateur bands. Should they be required to know what is beyond the boundaries of the 2 meter band? Of course not. I am merely making the point that there are varieties of ignorance and that one should not assume that an expert on one subject is knowledgeable on others.

> spending the rest of my life knowing that I might have been able to call for help and didn't.

This is probably a more pertinent consequence of failure to act. Any comment that I or anyone else could make on this would be meaningless. It is an individual decision.

> I think the assumption that hams, as a group, are sitting around with modified HT's eagerly in hand just WAITING for something as an excuse is damned insulting. I suspect that *MOST, NOT ALL* of us have a bit more common sense than that.

On this we agree. As a group, ham operators are more sensible than that. But there are those who behave exactly as described above.

I just don't believe in encouraging them, or sitting by idly while they try to persuade the more sensible that they can justify it.

> Amateur Radio
> operators have always been there when the chips are down and a
> community is hurting due to floods, fires, earthquakes, tornados,
> hurricanes or whatever disaster you can think of. The benefit

Let's not get carried away with our "emergencies." A community-wide disaster is a different situation from a traffic accident. As I pointed out in a previous posting (and it is even more apropos in response to the above) our value as amateur operators as a reserve communications resource to our communities has been based on handling disasters like you enumerated, not on our ability to make our radios transmit on police/fire/EMS/whatever frequencies.

> Amateur Radio is a proven one - so if the individual ham can
> show to the governing authority that he can communicate with them
> in such an emergency, on the spot, and (this is important) abide
> by whatever restrictions they set, what is wrong with that?

Nothing. But that type of situation was not what was being discussed here. If you have permission and have worked out a formal arrangement, then there is no issue. Except possibly Type Acceptance depending on what you are using for a transmitter.

> David, you seem to have an axe to grind against involving
> Amateur radio in public service activities. I read your posting

Not against involving amateur radio, but in the way some (not ALL, or even MOST) hams want to be involved.

> about doing things like taking the 2-meter band and/or the 440 band
> away from hams and giving it up to public service, etc. ad
> nauseum.

I got two or three thoughtful responses from people who had positive things to say about alternative solutions to the spectrum crisis that precipitated that posting. The rest were "they can't do that because..." and "how dare you!" type useless messages. That kind of approach will not and did not keep FCC (or nations convening a WARC) from reallocating spectrum that we hams would rather keep to somebody else.

> At the risk of creating yet another flame war on this newsgroup,
> perhaps you could explain why you seem so opposed to ham operators
> being involved - perhaps it would clarify "where you're coming
> from".

Fair enough. To help avoid a "flame war" I will begin with a disclaimer. This is not an indictment of amateur radio as a whole. I am presenting my opinions that are based on some local experiences. I do recognize that the situation is far better in other communities and my experiences should not be used as a reason to impair other hams' efforts to become legitimately involved in public service.

Several members of the local ARES/RACES group (they are one and the same hereabouts) believe that amateur involvement in public service activities should include some degree of actually "running the show." While the RACES RO manual and various articles and publications put out by ARRL state plainly that the amateur's function is strictly relaying communications, a few of these folks believe otherwise.

I was Disaster Communications Chairman for my local Red Cross chapter for about 2 years. To the chagrin of ARES/RACES leadership, the agreement between ARRL and the American Red Cross allows the Red Cross to appoint its own volunteers. Since I wasn't the person preferred by the local leadership, I got little or no cooperation.

During one major incident (an evacuation caused by a chemical plant fire), the EC/RO decided that he would shut down the net and send his people home. The Red Cross (the paid staff, volunteer leaders and myself) had not finished our operation or released the ham communicators. The County reps had not finished with them, either. A few cooperative hams volunteered to stay with us and keep passing tactical traffic until we no longer needed them.

Those few hams are the ones who really demonstrated the usefulness of ham radio, not the officious "officials" of the formal group.

ARES/RACES in my area has not been invited to be involved in the backup Public Safety communications plans. Their "rules" are too restrictive for police/fire/EMS needs and local government has found ways to provide needed services without them. Note that I put rules in quotes; Part 97 isn't the problem.

By the way, I speak not only as a licensed ham (NF2G) but as an experienced Public Safety Dispatcher for an area with a population of approximately a half-million people.

I don't want a big fight to start over this. These are local conditions and I don't apply them to the situation in general. Besides, I have not been actively involved in ARES/RACES in about 5 years, so maybe the leadership and attitude have changed. I hope so.

>administration.

I know of one ham/ sophisticated Mensa SWL who lives in Dallas where they have begun to do the same thing who has been very successful at reprogramming a junk trunked radio to follow conversations and scan the various services (all of them, not just the ones they want you to hear and give you a radio set up for if you are lucky). He has disassembled the microcode and patched it to handle the message formats for the systems in use in his area.

I am convinced that a cheap 80X86 laptop could be easily programmed to control a R-7000 or two to do the same thing and also other naughtiness such as following cellular calls from cell to cell. All it takes is some simple mods to the radio to make it capable of copying 10 kbs +- 4 khz deviation fsk which is pretty universally used as the signalling format and the appropriate interface to the laptop to read the packets.   The rest is 'just' software.

If my friend in Dallas had more time and business sense or if I did myself one of us could build and sell a 8751 based box that clips onto a scanner discriminator and reads, error corrects, and ships out a serial port in ASCII the signalling packets. This would make software to control a scanner pretty trivial. Unfortunately the number of software controllable scanners is limited although many can be modified to be by someone patient and skilled enough.

So a business opportunity await the first bloke who builds and markets such a device and offers software to allow a radio to follow the standard trunking systems in use.

Of course nothing within the resources of any private listener save bribing the man who distributes the keys can render DES encryption systems listenable.

I think we all have to accept that eventually (maybe even soon):

1. Almost everything of much general interest will be encrypted securely enough so that only stupid key management will render it vulnerable.

2. What isn't encrypted will be massively illegal to listen to and people will really be going to jail and having their equipment confiscated for trying. Simply enforcing a broad construction of the the present ECPA as it stands would go pretty far in this direction.

3. Scanners and other general converage radios will become contraband, illegal to possess regardless of what they are actually tuned to. This is the only way that enforcing an anti-listening ("privacy") law could possibly be practical, as the actual act of listening is so passive, private, and undetectable.

4. The public will be assured that now everything is illegal and the laws are being enforced that their unencrypted communications are quite safe (such as cellular phones), and private individuals will be slow to actually use available security technology. As a result both criminals, and the shadier side of law enforcement will be happily able to monitor private individuals for very questionable purposes well into the forseeable future.

"V" because it works well with the old mechanical bugs and even sideswipers.

> Half right. The RTTY calibration signal was (is) RYRY because
> of the way the mechanical teleprinters operated.

Well,partly. It is the bit arrangement of Murray-Baudot code. Sending "RYRYRYRY" causes the transmitter to spend very nearly equal amounts of time on MARK and SPACE. This made it possible to measure "average" magnet current. Also, it made it easy to tune to, even by ear. Back then, before modern frequency tolerance requirements, it also made it easier for the sending station to set frequency, because a "slow" counter would read out the channel center frequency, which is what military and commercial users go by.

Granted, this was all pretty primitive, but Good Grief, Charlie Brown, this is late 30's and early 40's technology we're talking about here.

I contend that your "many" in thr first sentence is really a tiny minority. Please don't tar us all with that brush, as you have been wont to do.

The second part of that is something I don't condone, but I again suspect
you're tarring many, many volunteers with the brush of your bad, but local,
experiences.

>   On this we agree. As a group, ham operators are more sensible

Then why do you toast people in other areas based on your (admittedly bad)
local experiences??

>   I don't want a big fight to start over this. These are local
>conditions and I don't apply them to the situation in general.

Yes, you do...you did in the message that started this war, and you did in
your replies to me. Now that you realize that your conditions don't apply
to the whole world, how about lightening up?

I tend to agree with this. Teaching in the college of engineering here, we don't tend to have too many females in our classes. So when we DO have female students, the he/she problem is even more pronounced. I tried to side step it for awhile, but the English language simply isn't equipped to handle it. If I make a statement like

"You ________________ have to be careful with your power supply bypassing when you combine 555 timers with other circuit elements because the 555 uses a big slug of current when it switches."

then what is suitable for the underline pronoun? You people ... sounds somewhat derisive (at least to me). You EEs isn't right because we have both EEs and CS majors. You DWEEBS had kind of a nice ring, but students complained that I was talking down to them :-) ... You STUDENTS sounds REALLY funny. So I've just settled back into "You guys". The first few times I say it I look straight at the female class members to make sure that they know there isn't any gender discrimination, but I'm using "guys" as a collective "engineering student" name. I guess I could use "you girls" but that IS sexist, being a derisive collective name used by Coaches and Drill Instructors (both the scum of the earth, IMHO) to deride a group of males.

If anyone has any reasonable, non-flame suggestions on phrases to use, I'd be interested...

What you heard was WWCR, a licensed shortwave station in Tennessee,
which has sold airtime on Sunday nights to the people that had operated
the pirate RNI when it was broadcasting in International Waters off the
New England coast several years ago. Alan Weiner was (is) the major
driving force behind the station, and has been involved in several
other pirate operations in the past. As you observed, they are
now just buying airtime on Sundays (0100-0400gmt) to air their
programs and to sell their material (e.g. video tapes of their ship
being raided by the Coast Guard and FCC)

I agree that deleting Novice and Tech is a mistake, but I don't think it will
result in opening up hundreds of Megahertz of spectrum for commercial use. It
may well turn 6 and 2 meters into dying bands with decreasing usage as the
old timers die off. It may reduce the number of HF amateurs. But HF and 6
and 2 are not the majority of our spectrum. They are merely the most over-
used part of our spectrum.

Q codes help the "communications process" along but they do not communicate
ideas. I consider true communication more than signal reports and QSL cards.
To have a meaningful exchange of ideas with another person, you must share
a common language that can comvey your thoughts to the other person. If all
you are thinking about is DXCC, then I guess that CW abbreviations of English
communication terms and Q signals are enough. I consider that a pitifully
small subset of the topics that I would want to talk about.

A mystique has grown up around the CW modulation method and the series of
shortcuts and signals that are not part of Morse per se, but are generally
used by CW ops, such that many people can't see the forest for the trees.
I can type "CUL OM" or PSE QSY U5" as easily as I can send it using CW and
the operator on the other end would understand it as well whether we used
the CW modulation method or not. The CW modulation method has it's place
in amateur radio, but it's still not a LANGUAGE. Some of the shortcuts and
Q signals are a language, but they form a very limited language designed to
facilitate radio communications. Try thinking about an abstract subject
without siliently using words; you can't. Natural language is the tool
we use to give concrete form to our ideas. It's not just a spoken
representation of what we think, it is what we think.

Dear Info-Hams,

I have an antenna question. What am I doing wrong? I am trying
to build a dipole antenna for a shortwave radio that will enhance

my reception in the 19 meter band. I am currently living
in Israel in a heavy concrete building. I have a book on shortwave, which
has a short chapter on antenna theory. I cut two 15.25 foot lengths of
10 gauge comon house wire, stripped it and affixed it about 0.5 inches
off the building with plastic insulators. At the center of the
antenna I soldered a 10 meter length of co-axial cable, which I think
is 58 Ohm. I then ran the coax to the antenna jack in the back of the
radio. When I switch the antenna switch setting to external everything
goes quiet (ie no static or reception). The antenna appears to be isolated
from the building. I have also tried grounding the outer portion of the
coaxial cable with no improvement.

Any help would be much apreciated. Thank you in advance.

David L. Hirschberg

When I was wanting to get started in the satellite photo hobby, I
found this article useful. Perhaps those of you who have been asking
about info lately will also find it to be of interest. Many thanks
to the original author(s). I finally decided to buy commercially
available equipment made by Vanguard Labs. I am using the Multifax
software from Schwittek. I have found that I'd like to get full
8 bit resolution which Multifax doesn't support. At some point in
the future, I plan to locate and utilize software that will support
8 bit resolution, but am presently too pre-occupied with other things.

One final note that I feel I must add is that I am deeply indebted
to the late Eric Roskos for his kindling of my interest in this

exciting hobby. Eric's postings of his wonderful 8 bit resolution photos at the FTP server VMD.CSO.UIUC.EDU in the directory PHIL.515 stimulated my original interest. Eric also was very responsive and helpful by answering the many questions a beginner like me had at the outset. Until his untimely death late this last summer, Eric continued to be a source of information and inspiration to the lot of us who shared his interest in observing the Earth from afar. I hope Eric has a delightful view of it now.

HOW TO RECEIVE APT PICTURES FROM THE NOAA SATELLITES

So you have decided you want to receive the NOAA and Russian METEOR orbiters and you have a radio that receives 137.500 MHz and a computer. So now what do you do? I hope this short dissertation will steer you in the correct direction.

To display a picture from the orbiting birds you need several things. First you need to 'acquire' the satellite. This means you need the program to calculate its position at any time and determine if you can hear the signals from the 'bird'. The best place to get this program is probably AMSAT-NA an organization dedicated to AMateur SATellites. They have several very good tracking programs for the IBM and also for Commodore and Apple as well. After you have acquired the program and have it running on your computer, you then need the Keplerian Elements for the NOAA satellites. These elements as well as some tracking programs are available from the CELESTIAL RCP/M, run by TS Kelso, at 513-427-0674 (Fairborn,OH) and from the Weather Fax and Remote Imaging DATALINK BBS run by Dr. Jeff Wallach, N5ITU as bulletins for some 80 + sets of satellite data. Another bulletin also tells you to what the printed numbers correspond so you can enter them into the computer program. Use the newest elements you can find as the orbiting satellites are subject to forces which change their orbits. If you use Keplerian Elements more than 3 or 4 weeks old, your chances of hearing the bird are reduced.

Once you are tracking the birds you should hear them on your receiver. They will be on 137.62 (NOAA-11), 137.500 (NOAA-10), 137.850 (Meteor 3-2), 137.4 (Meteor 2-16), 137.3 (Meteor 2-17 and 2-18). Now comes the first thing different about NOAA orbiters. The frequency deviation of the FM transmission is about +/-18-20 kHz. This is 4 times the normal deviation of a police call and 1/3 the deviation of the FM broadcast band FM signal. If you receive the signal on the regular communications width of the scanner the light areas of the picture will be noisy and the signal will sound distorted and the picture will basically be useless. If you use the FM broadcast bandwidth (assuming your scanner will let you), the signal will be weak and there may be too much background noise to see the picture.

So what now ? Well there are two ways to fix the problem, find a receiver with the proper I.F. bandwidth filter of 50 kHz, or modify the I.F. of your scanner to about 50-80 kHz. The simplest mod which has been found to be workable is to remove the narrow communications I.F. filter and replace it with a 0.01 uFd capacitor. This provides for good Wefax pictures from GOES and pretty fair NOAA orbiter pictures. It can of course result in retuning the radio, voiding the warranty and making the squelch not work properly.

The other characteristic of the NOAA satellite transmissions is THEY ARE WEAK. To get good pictures over a large area we have found a pre-amplifier to be essential. A GaAs-FET type can be obtained from various sources at a reasonable price but still about 50-100 dollars. You can also build one for about 25 dollars from plans for a pre-amp for the 2-meter amateur band and tune it to 137.5 easily.

Lastly, but importantly, the antenna can be of an omni directional, uniform pattern type such as a turnstile antenna similar to those used in the FM broadcast reception business but of course tuned to 137.5 MHz. Mount the pre-amp at the antenna if possible. Crooked coathangers on broomsticks have been known to work, and it is not difficult to build the antenna. Of course 2-meter beams with Az/El tracking will do the job well.

Now that you have a nice audio signal from the satellite, what happens next? The audio tone of 2400 HZ which is the carrier tone that is used to carry the picture information (video), must be detected and the video data converted from analog to digital and then displayed on the computer monitor by the software. The hardware and software to do this is available from several sources with more coming along. Several stand-alone boxes are also available that produce some form of computer output either in printed form or on the display. In addition the people on the DATALINK BBS may also have some data to share with you regarding this equipment.

One of the best sources for information is the WEATHER SATELLITE HANDBOOK available from Dr. Ralph Taggart of Michigan State University at 602 S. Jefferson, Mason, MI 48854 for $15.00. Taggart also writes the monthly WEATHERSAT column which appears in '73 Magazine. A must is THE JOURNAL OF THE ENVIRONMENTAL SALELLITE AMATEUR USERS' GROUP - JESAUG - which is published quarterly. It is available for $30.00 per year from the editor, Jeff Wallach, PO Box 117088 Carrollton, TX. 75011-7088 Back issues of the JESAUG are also available.

At the present the simplest software for the IBM is the Elmer Schweittek MULTIFAX software. A hardware kit is available from A&A

Engineering which includes the video dectector circuit and A/D converter. Input to the PC is via the game port. If you want to build your own, complete documentation to build an interface circuit on an IBM PC prototyping board is available from H. Paul Shuch, N6TX, for $6.00 - FAXBOARD.

The WEPIX(tm) software and hardware is available from Encomm. It will produce pictures of 1200 lines by 800 samples per line displayed at 640 x 350 pixels in 16 shades of gray or 16 colors using an IBM PC with 640kB, EGA card and at least one 360k disk.

Receiving Satellite Weather Photos

Hardware Interface to PC:

A&A Engineering, 2521 W. La Palma, Unit K, Anaheim, CA 92801,
phone 714-952-2114 - both AM dectector and A/D converter, input to PC
via game port (4-bits) or parallel I/O Interface (8-bits) - kit is
$50. - assembled and tested unit is $70.
Microcomm, H. Paul Shuch, N6TX, 14908 Sandy Lane, San Jose, CA 95124,
phone 408-377-6137 - FAXBOARD - A Weather Facsimile Display Board for
the IBM PC - Complete documentation to build your own interface
circuit on an IBM PC prototyping board - video and an 8-bit A/D
interface - $6.00

Video Detectors:

RTM Circuit Boards, 205 Elm St.,Van Horne, IA 52346-0400,
video detector (the 'Wilson Board') see QST Magazine, Jan '86 and
Vince Coppola's article in Oct 1988 73 Magazine
QST Magazine, August 1985, Grant Zehr article, page 27, video detector
circuit

A/D Converter & Parallel I/O Interfaces for the IBM PC:

MetraByte, 440 Myles Standish Blvd., Taunton, MA 02780, Model PIO-12
board for the IBM PC, phone 617-880-3000
John Bell Engineering, Inc, 400 Oxford Way, Beimont, CA 94002,
phone 415-592-8411

Clay Abrams Software, 1758 Comstock Lane, San Jose, CA 95124, software for the ROBOT 1200 - see QST Magazine, Jan '86

Ralph Taggart, 602 S. Jefferson, Mason, MI 48854, Weather Satellite Handbook Scan Converter - for the Radio Shack CoCo3 - see 73 Magazine, Nov '84 and Dec '84 and Handbook. Ralph Taggart also writes the WEATHERSAT column for 73 Magazine.

ImageWise Display/Receiver, Circuit Cellar Inc. - Micromint Inc., 4 Park Street, Vernon, CT 06066, phone 203-875-2751 - BYTE Magazine, May, Jun, Jul, Aug 1987. JESAUG 88-2 and Oct 1988 73 Magazine have information on how to build the video and A/D interface. Ver 2.0 software supports VGA graphics and 640 samples per line at 64 gray levels. With VGA the ImageWise Display unit is not required. The software is available for $29.95 from Vince Coppola, N1VC, 6 Bobbin Road, Terryville, CT 06786

ASAT: An Apple-based Satellite Imaging System by Grant Zehr, WA9TFB - QEX Magazine, March '88 - has complete information to build an excellent unit using the APPLE with a Redshift Ltd graphics card giving 256 * 256 pixels at a full 256 levels of gray.

AMIGA Imaging Software - Dallas Remote Imaging Group
PO Box 117088
Carrollton, TX 75011-7088
Voice 214 394 7325

- Uses standard Amiga hardware - no special display
- Powerful NASA digital enhancement curves built-in
- Digital image processing capabilities
- Uses A&A Engineering $49 demodulator
- Image saved for use by other graphics programs
- Full histogram analysis
- Full 8 bit data is stored on diskette or hard disk
- Unattended operation
- Can be setup in 30 minutes
- Call for special pricing

IBM-PC Interface Card and Software - Jim MacLean and Paul Atkinson, 2112 Parsons Avenue, Melbourne, FL 32901, 407-727-3646 - plug in card for IBM XT or AT, 9600 samples/second at 8 bits, automatic synchroniztion for NOAA, METEOR and WEFAX, data saved realtime to hard disk, supports CGA, EGA, and VGA, $300 for hardware and software

Complete Systems - Hardware and Software:

Dallas Remote Imaging Group

P.O. Box 117088
Carrollton, Texas 75011-7088
214 394 7325
Complete Earth-Scan Amiga turnkey system ready to put on air

YU3UMV Digital Storage and Scan Converter for Weather Satellite Images, described in VHF Communications Magazine, Winter 4/82 and Spring 1/83 - Modifications are described in the Satellite Users' Group Journal - JESAUG - available from Jeff Wallach. Back issues of VHF Communicatons and the YU3UMV printed circuit boards are available from Fred Sharp, TimeKit, P.O. Box 22277, Cleveland, OH 44122, phone 216-464-3820.

Loren Johnson, P.O. Box 219, Cleveland, MN 56017, system for the IBM-PC - $750, phone 507-931-4849

WEATHERTRAC[tm] IBM-PC Based Satellite Image Acquisition and Animation System - $1885 for EGA - $3495 for VGA, Fred Bartlett, Softworks, Inc, Allentown, PA, phone 215-395-4441 or George Isleib, Lehighton, PA, phone 717-386-4032

TRUfAX by CompuMAX IBM-PC based facsimile system - $600, Compumax Corporation, 26 West Boylston Street, West Boylston, MA 01583, phone 617-835-2722

Satellite Meteorology:

Satellite Imagery Interpretation for Forcasters - a 3 volume set published in 1985 for NOAA now available from the National Weather Association, 4400 Stamp Road, Room 404, Temple Hills, MD 20748, 301-899-3784, $32 for members, $45 for non-members (Membership is $20.)

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---

October 27 to November 06, 1990

Report Based In-Part from Data Obtained from the
Space Environment Services Center
Boulder Colorado

SOLAR TERRESTRIAL REVIEW AND SHORT-TERM FORECAST

Solar activity between 21 October and 27 October has been mostly Low. Moderate activity did occur early in the period due to several impressive energetic events suspected from Region 6311, which was (at that time) less than a day beyond the western limb. The most impressive was the M8.5/1N major flare of 20 October that was discussed in detail last week. On 23 October, evidence of a potential proton flare was observed when Type II and Type IV radio sweeps were observed accompanied with a slight proton enhancement at satellite altitudes. The Type II and IV sweeps were observed at 08:09 UT on 23 October. The proton enhancement began near 09:00 UT on 23 October. Analysis of the Type II and Type IV radio sweeps resulted in an estimated interplanetary shockwave speed of near 1,600 kilometers per second.

All of this activity was uncorrelated with any optical phenomenon on the visible solar disk. Considering that a region just beyond the west limb spawned the major flare of 20 October, it is reasonable to conclude that the source for the Type II and IV sweeps (as well as the proton enhancement) were likewise produced by a region beyond the west limb. This sets up the interesting possibility of potentially strong solar activity occurring with the return of these active regions in less than two weeks.

Solar activity since 23 October has been low with only minor C-class flaring and subflaring. Several solar filaments also disappeared this week but had almost negligable impacts. The sunspot number for 28 October was 139. The running sunspot number for 28 October is 150. The 90-day average solar flux value is 194.

Geomagnetic activity was low early in the period, but reached minor storm levels on 24 October due to an equatorial coronal hole. Conditions at middle latitudes were mostly Active with at least one minor storm-level magnetic excursion occurring between 12:00 UT and 15:00 UT on 24 October. High latitudes experienced periods of minor to major storming. Activity may have been enhanced somewhat from the large filament which disappeared near 20 October.

Auroral activity reached moderate levels at middle latitudes, while high latitudes experienced predominantly moderate activity with bursts of high auroral activity. Low latitudes unfortunately, were unable to spot any auroral activity.

Radio propagation conditions were good throughout most of the period and over most paths. The only exception was 24 October when degraded conditions were noticed over high and middle latitudes. Periods of poor propagation occurred during the local evening hours due to auroral-induced signal flutter at middle latitudes. The geomagnetic and auroral activity was expected to last longer than it did, but conditions recovered rather quickly on 25 October to near normal.

Solar activity is expected to remain mostly low throughout the next 7 to 10 days (28 October to 06 November). The solar flux appears to have bottomed out for this solar rotation with a minimum of 154 occurring on 26 October. Flux values should begin to rise now with the gradual return of the active solar hemisphere.

We are currently facing the inactive hemisphere of the sun. The sun has maintained a trend of one active and one inactive hemisphere for many months now and is expected to continue this trend into 1991. There is a fairly well positioned coronal hole near the solar meridian (on 27 October) that should have a slight to modest impact with the earth between 29 and 30 October.

Geomagnetic activity is expected to remain mostly quiet to unsettled throughout the next 10 days. The exceptions will be 29 October through near 31 October. At that time, geomagnetic activity is expected to be enhanced somewhat due to the coronal hole discussed above. Conditions may reach active levels at middle latitudes with K indices of 3, peaking possibly at 4. A-Index values for middle latitudes on these dates should range from 10 to near 16. Activity is expected to peak on 30 October over middle latitudes. High latitudes may experience brief periods of minor storming with potential peak K indices near 5 and associated A-indices ranging from 15 to 26. High latitudes will experience most of the activity associated with the coronal impact. Activity over high latitudes should peak on 29 or 30 October. Geomagnetic activity should subside again to mostly unsettled levels for the remainder of the week.

Auroral activity is also expected to become enhanced between near 29 October and 30 October. Activity will remained confined to the high latitude regions where mostly moderate activity should be observed with potential brief bursts of high activity. Middle latitude regions will be able to spot mostly low activity. Low latitudes will likely be unable to spot any auroral activity. Activity is not expected to be very intense.

Lunar phase will interfere with attempts to spot auroral activity this week. Taking lunar phase into consideration, auroral activity will not be visible from low latitudes. Activity at middle latitudes will appear to be of low intensity and may not be visible at all due to the brightness of the northern horizon caused by the moon. High latitudes, however, should easily be able to spot auroral activity despite the brightness of the moon. Activity at high latitudes, however, may appear lower than it actually is, due to the lunar interference.

Radio propagation conditions will remain good throughout the week, except for the period of expected increased geomagnetic and auroral activity between near 29 October and 30 November. Propagation will become noticably degraded at high latitudes as auroral activity produces moderate to strong signal flutter over many HF frequencies. Middle latitudes will notice a slight decrease in propagation quality and signal behavior but should, for the most part, retain good to fair propagation. Low latitudes should remain unscathed by this activity, maintaining mostly good to very good propagation conditions throughout the week.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 27 OCTOBER

Region #	Location	LO	Area	Class	LL	Spots	Magnetic Type
6326	S26W71	040	0030	HRX	01	001	ALPHA
6327	N20W61	030	0450	FAO	20	010	BETA

    |    Conditions     |    Given in 3-hour intervals   | Intensity  |
    |_________________________________________________________________|
```

NOTES:

This graph ONLY depicts geomagnetic conditions observed at Boulder, Colorado for the past 87 hours. Conditions to the north of Boulder will generally have slightly higher activity than Boulder, while conditions to the south of Boulder will likely have lower activity than those depicted here. However, the plots should present a good approximate average of planetary geomagnetic conditions.

"Anomaly Intensity" is meant to represent nothing more than a very rough guide to the --potential-- interaction geomagnetic fluctuations --might-- have on earth-based systems sensitive to magnetic fluctuations (ie. electrical power distribution networks, telecommunications networks, etc.).

For radio signal propagation purposes, plot lines are approximately proportional to propagation quality when plot lines are below Minor Storm conditions. Propagation quality may deteriorate rapidly (ie. non-proportionally) when plot lines reach or exceed Minor Storm levels. Complete radio blackout conditions on all short-wave frequencies may occur if plot lines reach or exceed Severe Storm levels.

PLANETARY 10-DAY GEOMAGNETIC ACTIVITY OUTLOOK (28 OCTOBER - 06 NOVEMBER)

   |_______________________________________________________________________|
```

NOTES:

Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

GRAPHICAL ANALYSIS OF SOLAR ACTIVITY OVER THE PAST 60 DAYS

            --------------------------------------------------------
```

NOTES:

Latitudinal boundaries are the same as those given above for radio propagation quality. Periods of high auroral activity may be suitable for auroral-propagation. Locally visible moderate auroral activity will almost always cause moderate to strong deterioration in HF signals, while locally visible high auroral activity will render most HF bands useless.

Auroral activity is defined as follows:

NOT VISIBLE: Not visible

LOW: Diffuse, inactive auroral activity visible very near the northern horizon for mid and low latitudes.

MODERATE: Visibly active, but not exceptionally bright auroral activity most visible above the northern horizon for mid to high latitudes. This type of activity usually encompasses torch-like (or beam-like) aurorae mixed with low-intensity curtain aurorae.

HIGH: Visibly very active, with periods of bright, pulsating curtain aurorae possibly mixed with moderate intensity zenith aurorae. Can occur to the north as well as stretching up near the zenith, particularly at middle latitudes. There may be some color fluctuations discernable.

VERY HIGH: Very active, very bright and very colorful auroral activity possibly mixed with intense zenith and curtain aurorae. Visibly strong pulsations with auroral boundaries to the zenith, stretching even partway to the southern hemisphere of the sky.

EXTREMELY HIGH: Rare, incredibly bright auroral activity with rapid color and brightness fluctuations mixed with very strong rapid auroral pulsations visible throughout the entire sky.

There are three plotted lines per day in the auroral activity prediction charts. Each of these three plotted lines represent three periods during the evening/morning when auroral activity can be seen. The first line represents the evening twilight period. The middle line represents the --local-- midnight sector, while the last line of each day represents the morning twilight period.

The auroral activity predictions charts are heavily based on recurrent phenomena and may not be accurate in the longer-term due to unforseen and unpredictable transient events (ie. such as solar flares).

The visibility of auroral activity depends on your location and the brightness of the sky (which is dependent upon both city lights and lunar phase). These charts do not account for these variations. The charts are based on dark-sky conditions (lunar phase excluded). Aurorae occur independent of sky brightness, so just because auroral activity may not be directly visible (due to lunar phase, for example) does not mean auroral activity isn't in progress.

I have a question regarding antenna technology, one of the areas of Amateur Radio I don't know very much about. I hope someone can give me some insight:

I have some superreg receivers, to be used during a fox hunt. They are built for 2m. Each one consists of a box with two 1/4 lambda antennas (symetrical fed):

```
          50 cm     _____     50cm
     ---------------|   |---------------
                    |   |
                    |   |
                    -----
```

For a couple of reasons, I want to change these boxes for usage on 6m. Changing the receiver itself is no problem. making the antennas work is a problem: if possible, I want to use the same antennas. 1/4 lambda antennas for 6 meter become a problem to handle (3 meters long!).

I am thinking of adding a coil in series with each antenna wire in the box.

I think this has been done before (CB antennas come to mind).

Question rises if this is a Good Idea:
1. What value should these coils have? How do I find these values?
2. Will a base-loaded antenna like this still work for direction finding?
3. Other things to look out for?
4. Better approaches?

The idea is that I can change the receivers back to 2 meter when our special 6m license expires. That is one of the reasons not wanting to change the antennas.

I hope you can help me out. Thanks in advance,

73 Geert Jan PE1HZG

As quoted from someoen whose attribution never made it here:
+---------------
| >>>>CW is the FUNDAMENTAL TRADITION of Amateur Radio. Without it you ain't no
| >>>>ham.
+---------------

Gee, that's funny... I see in the five fundamental principles of amateur radio no mention of the retention of CW as an active mode. I suppose it's time to petition the FCC to correct this oversight?

You may like CW, I like CW, but that does not mean that CW or any other so-called "FUNDAMENTAL TRADITION" should be forced down everyone's throats.

(Why, oh why, am I writing this? I persist in expecting rationality from people when I should know by now that everyone expects their own beliefs to be the ultimate law for all others. [For the sarcasm-impaired: HEAVY sarcasm.])

| > I just got some info. in the mail about a new publication for
| > Ham Radio. It is called Communications Quarterly. From reading the
|
| It is supposed to be a technical quarterly to help take the place of
| the vanished HAM RADIO magazine.
|
| No one has seen a copy yet, but my reaction is that it sure is
| EXPEN$IVE. Costs as much as a monthly magazine, but it only comes
| out quarterly.
+---------------

You expected differently? If there were advertizers out there for techie
magazines, HAM RADIO Magazine would still be around, instead of being a nod in
the general direction of technical hams by CQ.

I'd like to see an issue myself. If it turns out to be a good technical
magazine, I'd be willing to shell out for it; <insert favorite deity, if any>
knows the companies which cater to appliance ops won't.

| >don't have to guess, you can actually find out the answer and post that.
|
| It's even easier than that. The table of international prefix allocations
| appears in at least five places that I know of:
|
|    o ARRL log books, as Derek mentioned
|    o The North American Callbook
|    o The International Callbook
|    o The DXCC Countries List
|    o The ARRL Handbook
```

+---------------

Not to mention the back of the Gordon West/Icom "HF Band Limits" card, which I got with my Tech/General theory set and keep next to my radio. I don't have to ask, just look it up in the chart.

Someday I may arrange for something to make this even more handy, ex. a Mac DA (small app. if/when System 7 comes out (hint, hint)). But for now I use the chart with no problems. (Then again, a sloping dipole with a max. height of 25 ft. and mostly in the shadow of a building does not make for a DX hunter.) (On the other hand, there's been an impressive number of DX calls on my backup 10m sideband rig the past few days. No doubt the CQWW sideband contest is partially to blame [;-)] but I still can't believe I'm hearing them. If I cared about contesting I might try contacting them....)

As quoted from <1990Oct24.170127.2103@dcdwest.uucp> by plb@dcdwest.uucp (Phil Blais):
+---------------
| I have very mixed feelings re the communicators license. From the
| traditional viewpoint "if had I to - so shud you" attitude I'm against
| the no code license. IMHO the no code advocates are sterotypical of the 'me'
| generation i.e. want it all but aren't willing to work for it.
+---------------

Tradition holds no weight with me. The laziness argument holds no weight with me because it is a negative argument with no corresponding positive argument.

I request *again* reasons why CW *should* be required of *all* hams. Reasons which do not boil down to negative arguments but positive ones saying what specific benefit comes of requiring CW of all hams *and* *proving* *it* --- the few respondents providing positive reasons have so far stumbled because of either the proof or the requirement that it apply to *all* hams. Since in four months, three online services and the local club have yet to succeed, I don't expect anything this time, but I give you the chance anyway. *Convince* *me*, I will accept reasonable arguments if you can prove that they actually apply to the topic at hand and not a straw man (like a local club member likes to use) or something worthless to the survival of U.S. ham radio like tradition. (Traditions are great, but they won't stop the FCC from parceling out our bands to the highest bidder a' la 220MHz.)

Awaiting what will in all likelihood be much heat and no light,
++Brandon

Most of the problems I see posted regarding RF <-> automotive problems look to me like the computer getting into the radio or the other way around. As we put more and more computers in cars the interference problems are going to increase.

In reading through some of the literature an automotive and agricultural networks I find that Chrysler has standardized on a single wire network connection among the various embedded computer that will be scattered around cars of 90's. This would be a wire of some length say, 2 meters terminated by computer gates of about 100 ohms impedance if I my recall is correct this is called a Beverage antenna. To keep interference down in either direction will be interesting.

Some of the automotive networks operate at 1 megabaud. With
the forecast death of CW maybe we could use these soon to be
abandoned bands as inter automotive comunication.

Herbi,

Points 3, 4 and 5 are personal opinions. Points 1 and 2 are provably false assertions. See my Reply Comments on PR Docket 90-55 for the details; I posted it here back in early September.

None of your points constitute valid arguments against a codeless license, although you are perfectly free to promote voluntary proficiency in or use of CW by anyone who will listen.

Phil

die@cpoint (David I. Emery) writes:

>   I think we all have to accept that eventually (maybe even soon):

Sorry, I do not accept the eventuality of it. But I certainly do
acknowledge the POSSIBILITY of it, and that this possibility can be
a certainty if we take not action and let it.

>   1. Almost everything of much general interest will be encrypted
>securely enough so that only stupid key management will render it vulnerable.

This is likely to be the case and is what SHOULD happen.

>   2. What isn't encrypted will be massively illegal to listen to

>and people will really be going to jail and having their equipment
>confiscated for trying.   Simply enforcing a broad construction of the
>the present ECPA as it stands would go pretty far in this direction.

This could happen, but strong lobbying, with encryption technology as the
evidence can prevent this. If it can be held out until #1 is well under
way to full implementation, then #2 won't really become a worry anymore.

>   3. Scanners and other general converage radios will become
>contraband, illegal to possess regardless of what they are actually
>tuned to.   This is the only way that enforcing an anti-listening
>("privacy") law could possibly be practical, as the actual act of
>listening is so passive, private, and undetectable.

While the USSR becomes freer, the USA becomes more restrictive. This
is also not an eventuality unless we let it be (and we seem to be).

Such a ban would have severe consequences. Ham radio operators would
not be able to check for harmonics in their signals, and ham radio itself
could have its very existance threatened.

>   4. The public will be assured that now everything is illegal
>and the laws are being enforced that their unencrypted communications
>are quite safe (such as cellular phones), and private individuals
>will be slow to actually use available security technology.   As a
>result both criminals, and the shadier side of law enforcement will
>be happily able to monitor private individuals for very questionable
>purposes well into the forseeable future.

This won't happen unless government causes encryption to be compromised
in some ways. It has been suggested by some that DES is so compromised
by the NSA. Even if that is true, they still need a significant (though
apparently they have it) computational power to break it. They cannot
listen to ALL communications.

Computing power continues to increase. What was once mainframe power is
now in your hand. Imagine what a collections of 65,536 processors of 1999
technology will be able to do. It will be necessary for cryptology to keep
up with this (theoretically it can) and for that to be available to everyone
for their appropriate communications (paranoid governments won't allow it).

Presently cryptographic technology has more restrictions that general
coverage receivers. Think about it.

Here I go again, trying to reason with folks whose minds are made up and won't listen to (or will twist into their own shapes) anything that doesn't fit their prejudices. Was it Phil Karn who pulled out the straw-man demolisher posting last time? Maybe it's time for a repost.

As quoted from <9217@b11.ingr.com> by herbster@b11.ingr.com (Joe Herbster):
+---------------
| In article <1990Oct24.200305.9402@athena.mit.edu>, tmurphy@athena.mit.edu (Thomas C Murphy) writes:
| > In article <1990Oct24.170127.2103@dcdwest.uucp> plb@dcdwest.uucp (Phil Blais) writes:
| > >
| [trimmed.....]
| > >the no code license. IMHO the no code advocates are sterotypical of the 'me'
| > >generation i.e. want it all but aren't willing to work for it.
| hmmmmmmm......get out the asbestos suit......
| > Sometimes I think I'll scream if I see this type of comment one more
| > time.
| sounds like the whining "me" generation to me..........
+---------------

I am sick and tired of all the self-proclaimed Gods of Ham Radio who insist that because they like Morse Code, they have the right to force it on everyone else. Since when does the fact that you like it count for anyone except yourself?

And DON'T spout laziness at me. I learned the code at 5wpm, am polishing my 13wpm and looking toward higher speeds. I *use* CW. Yet I see no reason not to have a no-code license. (One straw man demolished.) And laziness, as spouted by all you pedagogues, sounds suspiciously like whining about YOUR work in learning Morse Code being supposedly declared worthless, BECAUSE YOU HAVE YET TO PROVIDE A GOOD REASON FOR ALL HAMS TO LEARN MORSE CODE.

(Note the *supposedly*. Another straw man demolished: we are not declaring CW an illegal or invalid mode, just stating that it is not the Exalted All-Highest GOD MODE.)

More straw men below: lots of folks beat you to it, but none of them passed *all* the tests, then or now.

```
+---------------
| 1) EFFICIENT.  CW is conservative of band spectrum.  CW is "THE" QRP
|        mode.  CW is "fault-tolerant" as a digital mode.  The good
|        old gray-matter processor still beats the best CPU algorithm
|        ever written for pulling meaning out of the mud.
+---------------
```

Fine, so CW is a good mode for getting through. It is efficient ONLY in terms of bandwidth, however; it absolutely flunks the test of efficiency in practical terms, e.g. information flow vs. time. And its inefficiency in that respect is the main reason it can get through when other modes can't.

Moreover, this doesn't demonstrate a requirement for all hams to know or use it. If the bandwidth argument were *that* important, land mobile would be using CW. And some of us aren't able to work QRP (in my case, I have no way of getting a hundred milliwatts to go anywhere except into the walls of the courtyard surrounding my apartment; I get d*mned little signal out of here with 100 watts into the antenna!). And in any case, QRP is not a fundamental purpose of amateur radio.

```
+---------------
| 2) SIMPLICITY.  CW is the simplest form of communications to build a
|        transmitter or receiver for.  New hams can be encouraged to
+---------------
```

Transmitter, yes. Receiver, no. Or have you, presumably more experienced with older equipment than I, forgotten that one can build an AM reciever using a single crystal and very little else? Or even a nail?

```
+---------------
|        excessive cost.  In the event of an EXTREME emergency, this
|        is the easiest mode to "Improvise-and-communicate" with.
|        CW requires no modulation, modems, software, .....
+---------------
```

In the event of an EXTREME emergency, if I have anything around to improvise FROM, it's probably a 2m or 220MHz HT which is in working order. If I don't have that around, chances are bI have nothing else from which I can devise *anything* except aformentioned AM receiver.

```
+---------------
| 3) FRIENDLY.  CW at 15wpm+ lopes along at an easy conversational pace
|        allowing one to think of something interesting to say while
|        sending.  CW even has a parallel to the smiley .... ..
+---------------
```

Good. Now why does this apply to ALL HAMS ALL HAMS ALL HAMS ALL HAMS ???????? The favorite straw-man tactic: tell us why it's good in and of itself, not why it's so good that all hams ABSOLUTELY MUST WITH NO EXCEPTIONS learn it.

+---------------
| CW may be used by the speech impaired, sight impaired, and
| the hearing impaired equally without extensive adaptation.
| It is difficult to scream, rant, or rave in CW.
+---------------

This I will grant. It still doesn't make it exalted to the point where all hams MUST BY LAW WITHOUT EXCEPTION demonstrate proficiency in it.

+---------------
| 4) HISTORIC. (this is where the flames will come from ;-) Samuel Morse
| and his code have been historically significant to the
| evolution of Amateur radio. It is also the only digital
| mode easily recognized by non-amateurs in movies etc. CW has
+---------------

So show me the line in Part 97 that states that amateur radio exists to provide a showcase for historical radio equipment and procedures. What *I* see in Part 97 is:

"SECTION 97.1 BASIS AND PURPOSE

" The rules and regulations in this Part are designed to provide an amateur radio service having a fundamental purpose as expressed in the following principles:

"(a) Recognition and enhancement of the amateur service to the public as a voluntary noncommercial communications service, particularly with respect to providing emergency communications.

"(b) Continuation and extension of the amateur's proven ability to contribute to the advancement of the radio art.

"(c) Encouragement and improvement of the amateur service through rules which provide for advancing skills in both the communication and technical phases of the art.

"(d) Expansion of the existing reservoir within the radio service of trained operators, technicians, and electronics experts.

"(e) Continuation and extension of the amateur's unique ability to enhance international goodwill."

Please note that CW is not mentioned even once, nor is preservation of antiquated radio techniques. Moreover, CW does nothing at all for (b) and (d) and does little for (a) (both voice and, increasingly, packet have supplanted it because they are more efficient IN TERMS OF INFORMATION PER TIME and because they are conducive to third-party emergency communications).

(c) is irrelevant, because it is an inverse relationship, i.e. it says nothing about how any form of communication enhances the amateur radio service but instead how the amateur radio service can enhance any form of communication.

What's left is (e). Which is the straw man EVERY ANTI-COMMUNICATOR ends up with, because it's the only one that has anything remotely resembling a good argument for it, along the lines of it's *already* used that way. (Yes, I know, you say you aren't anti-Communicator. Nevertheless, this is the most popular argument.)

Another straw man trashed: what's used that way is not CW, but prosigns and Q signals. Both of which are used on packet, and Q signals can be used on voice --- and simple single words are used for the prosigns. To express anything not covered by prosigns or Q signals in voice, packet, OR CW, you still need a language in common.

```
+---------------
|        its roots in pre-telephone telegraph communications.  How can
|        children play "cowboys-&-Indians" without a rail-road telegraph
|        operator??
+---------------
```

I know the argument by tradition / history is common, but an argument by *sentimentality*???! Oh, come on. This one doesn't even deserve refutation. Relevance index: zero.

```
+---------------
| 5) REWARDING.  Communicating via CW is a "SKILL" and thus rewards the
|        operator with a sense of accomplishment and satisfaction.
+---------------
```

Communicating via QRP SSB is a SKILL and thus rewards the operator with a sense of accomplishment and satisfaction.

Communicating via auroral propagation --- any mode --- is a SKILL and thus rewards the operator with a sense of accomplishment and satisfaction.

And please demonstrate that this applies to all hams, and that this is the ONLY way to gain a sense of accomplishment and satisfaction.

So: five straw men proposed, five demolished. Next?

+---------------
```

Try saying it over voice. (Oh, oh, another argument in favor of CW --- except that it's obviously workable on packet, too. Oh, well, maybe they'll just ignore that annoying little fact liek they do so many others.) And even in CW/RTTY/packet, it's a pain.

I used to use "s/he"; now I just use "they". Easier and less messy. And less annoying to read.

> What? One minute solid copy or answering 7 of 10 multiple guess questions
> on received text is a test of on-the-air procedures? I hope not!

I agree with you there. In fact, I would like to ask whether any VEs are giving the code exam with multiple-choice questions. It seems to me that such a method would partially defeat the purpose of the test. The fill-in-the-blank questions that I had to answer when taking tests from the FCC examiners are a better check of accurate copy.

> CW is a MODULATION method not a LANGUAGE! Whatever language you

That is true. Prospective hams are given a Morse code test, not a CW test. Many ignore the distinction.

> Deep Space Network other techniques are used. CW is as valid a modulation
> method as AM or FM and deserves as much attention on the exam as AM or FM
> modulation receives.

You can even send Morse code on AM or FM!   ;-)

No, not HF CW. Try LF packet radio. Have you heard of the Ground Wave Emergency Network (GWEN)? It is specifically designed to work after the Big One is dropped.

You have to admit that for this application, packet has some nice advantages over CW. For example, it'll keep working after all the humans on the planet (yes, this includes all of the CW operators) have been killed off by radiation. (Remember "On the Beach"?)

I may not think much of the doomsday thinking that led to the construction of GWEN. But I must admit to being glad to have it around because I can use it to annoy the heck out of the "CW, vacuum tubes, blood and guts forever" types who keep insisting that they'll have a complete monopoly on communications after a nuclear war has toasted all of the more modern electronics... :-)

VVV ... well the VVV is an old telegraphers convention... sort of like "wake up down the line, I'm gonna send some..."

RYRYRYRY in baudot was not exactly a cal, but a tuning / check the stuff is working...

both serve a similar "test" function. (or so my memory tells me)

>
>   ......True, but fees are not the issue (at least for guys with bux)

As you say, for the discussion in question, it is not specifically relevant,
but a fact nonetheless.

Just remember, it IS an issue for some people. Some kid who gets a fixed
allowance and no help from parents may disagree. Also, some people gripe
about the "THROW MONEY AT IT" theory of solving problems. (but that's another
discussion thread!)

> > Suppose I have gone over the questions the examinee missed, and the

>
> ......Do you run off several different tests for each session and check
> them to see that there are no questions are duplicated?

The exams are taken from W5YI-VEC distribution kits. The VEC prints the test sheets and provides keys and answer sheets. We have one of each different exam. We give the applicant the exam and an answer sheet, and put the exam back in the file when we are through. W5YI-VEC makes up the exams. One question might be on two exams. It is unlikely (but not impossible) for someone to get the exact same question twice.

We trust the VEC on two counts:
(1) The exams are correctly constructed, (including the keys)
(2) The exams in the set for each element are different.

We have had occasion to correct problems with keys (typos, etc.) and some problems go back to the Question Pool itself. We accept the exam sets in good faith and administer them as such. Errors occur rarely enough for us to have confidence in the exams as they stand.

As the bumper sticker says: "SH** HAPPENS!"

> I don't know about other teams and VECs, but our VE team has exam sets
> consisting of several exams for each element. Every applicant that comes
> through our group has an index card with the date, which exam element and

> questions that were on #XX? In that case, what would be wrong with
> telling me which questions I missed, and going over the correct
> answer; or quickly covering the point(s) the question covered?

What would be wrong with it? In my PERSONAL opinion, nothing. But I don't make the rules. (For that matter, the VEs don't, either, so blaming them is "killing the messenger"!)

From a VE point of view, possibly three things:

(1) Time. If there are a dozen folks taking exams, you can plan on a long session, just giving exams and recording what has to be recorded and filling out the 610s and CSCEs and other paperwork.

Is the applicant willing to wait till all that is over?

If so, IMHO, I believe the VEs should be able to tell them the question numbers (like 3B-4.121 or whatever) then if there is further discussion, it is "offline".

(2) Examiners are not trainers. That's not the purpose of the examination. The examination is intended to assess skills and knowledge, not to teach.

I can give sample exams in a class or a coaching session, but that's training, not an official, creditable exam. We can then go on and discuss what they missed and why.

Someone who is studying on their own can go through all the questions or sample exams and see if they agree with the answer. If they dispute what is in their study material, they can follow whatever steps they deem appropriate.

(3) The rules state what the rules state. Read the rules. IF you think the rules are wrong...[you probably know the rest...]

I believe (not based in fact, I claim no clairvoyance into the minds of the FCC and/or the VECs!) the rule is a continuance of the same rule that applied to some GS-something clerk who used to administer the exams. If you were lucky, you got an "FCC Engineer," but not always.

<<ACTIVATING O.F. MODE>>
(I'm trying to remember the exams I had, and I think I've seen both?)
<<O.F. MODE OFF>>

> If someone comes in who's been with us before, we check and give them a different exam for the element they want. We actually do check, and keep records. That's the best, I think, that we can do, and I think also in most situations, it works. There's always an exception.
>
> > How can I, as a conscientious VE, adhere to the intent of the rules in a case like this (and it is *bound* to happen). It seems to me that I should either not review the missed questions, or I should not allow the examinee to re-take the exam until (24 hours? 3 days?) later. How say ye, sincere netters (and flamer-throwers, too)?
>
> OK here's a scenario. Many VE teams in the Dallas area are W5YI-VEC sponsored. The VEC provides test kits (several exams, appropriate keys, and stuff) to the VE teams.
>
> An individual *-could-* go to VE Team X in the morning, attempt and fail exam 3A-#Z90 (a fictitious number) then go to the next suburb, to where VE Team Y is giving exams that afternoon and get the same exam. VE Team X and Y do not exchange records because the problem is not one that is worth the effort.
>
> ......I'm with you here, but the question was whether I can get the same questions again from *your* tests; not whether I could go somewhere else and see the same questions.

Right. We are really only intending to control our OWN sessions, not anyone else's. It's potentially more bother than it's worth to try and circumvent it.

> The original posting had to do with VEs who refused to let the examinee know which questions he/she missed. If you don't give the same questions twice, I don't see where it's a problem; even if, as one poster stated, the VE's review the correct answers.

The way I read the rules, you only tell them (1) pass/fail and (2) the number missed ((NOT WHICH ONES, JUST HOW MANY!!)) I'll look at that again. Thinking as a test-taker, the specific results (what you missed) might be perceived as a guideline. But as a test-designer, I think the specifics merely point out areas of weakness.

Whether the rules specifically state that you are NOT to do it (as I thought they did) or just state that you don't HAVE to do it, I would have to look again and examine more closely exactly how it is worded.

> As a matter of record, I favor *not* doing this, since I think the
> way the writtens are administered makes it too simple anyway (e.g.
> you can get sets of the exact questions to study, along with the
> answer keys).

Speaking as a trainer as well as a VE, I would be inclined to make a note of the TOPIC AREAS they missed and encourage them to work in those areas. Whether you discuss the specific questions at that time might or might not be helpful in terms of what the person learns. (Unless they are simply parroting "the answer to question 3B-4.121 is 'C'." as opposed to actually learning the material.)

For me, ((PERSONAL OPINION HERE, TAKE IT AS SUCH!)) part of the preparation for a test is knowing the material. Not everybody feels that way. <sigh!>

From the standpoint of making sure the tests are correct, of course, we still find mistakes from time to time. It's a benefit to the VEs to make sure the keys are correct. But that should be (ideally) before the test happens.

OBSERVATION: There are good politicians and bad politicians and good cops and bad cops and good hams and bad hams and good teachers and bad teachers and you can expect there are good VEs and bad VEs. We're dealing with people here, and there are as many different personality types are there are different persons.

There are even good test-takers who study and prepare and pass, or if they don't pass, they have a pretty good idea what they don't know, and go on to do something about it-- (the "IGNORANCE IS CURABLE" theory).

Conversely, there are bad test-takers who get upset that the test is not super easy for them. Even though thousands of others have passed the test, because they didn't pass, THERE MUST BE SOMETHING WRONG WITH THE TEST! (the "EVERYONE IS OUT OF STEP BUT ME" theory).

As far as going over the test at exam time? Is it really trying to find out what was missed, or is it trying to catch the examiner? I can't answer that. Each test taker is different. Read the rules. Follow them or change them.

73==> and keep :-)ing.

Actually, they are more correct than you might suppose. All the wireless LAN products I have seen advertised operate in 902-928 MHz which is also allocated to...amateur radio, ISM (industrial, scientific, and medical), and a few other oddball services. It would be legal to build a 910 MHz microwave oven and I have data sheets for 910 MHz magnetrons for industrial equipment.

regards, Phil N7AHL

It is annoying that cars put out as much noise as they do. I am working on automotive network now and I had to wrap the damn thing in aluminum foil so I could get it to work inside a IBM PC. We have also had trouble with handi-talkies wiping out the automotive computers. By passing, shielding, rf chokes and grounding cure our problems. But Detroit can't afford the $5.00 worth of parts to do this.

The problems are not likely to get better in the short run as some of the stuff has a 16 Mhz clock and generates noise to at least 300 Mhz. It is also extremely susceptible to interference.

My sins have come back to haunt me. I am need to get the computer noise out of a 1990 Bronco. Any and all help is very welcome.

A friend of mine who recently retired from a post-USAF carer as a pilot on corporate jets told me a few weeks ago that this system is not panning out too well because of the QRM that occurs regularly at 30,000 feet or higher.

An excellent GPS receiver is the TANS from Trimble Navigation. Very
small, low power, and easy to use. Antenna is about 5x5 inches, low
profile phased array. The best part is that unlike some of the models
made for the boating world (like Magellan), the TANS has an RS-422
port and transmits latitude, longitude, elevation, speed, time, and
diagnostic data. Easy to interface. I'm putting one on my bicycle
for nav, mapping, and security.

Contact the company at 800-TRIMBLE or 408-730-2900 (they're in
Sunnyvale).

It is supposed to be a technical quarterly to help take the place of
the vanished HAM RADIO magazine.

No one has seen a copy yet, but my reaction is that it sure is
EXPEN$IVE. Costs as much as a monthly magazine, but it only comes
out quarterly.

I am interested in building a morse code decoder for a Macintosh.
So I am looking for the following:
- schematic for a low cost A/D converter which could send the samples in serial form for capture via the Macintosh serial port
- reference to articles on algorithms for morse decoding; I am looking for something that could automatically adapt to varying speed etc...

I am interested in building the converter and writing the program on the Macintosh (in C) myself, not in buying something ready made. Thanks.

Gentlemen and Ladies;

I originally sent this message privately to a couple of folks on the net, but with the recent flurry of conversation on car RFI, I thought there migth ht be someone with some constructive comments.

You can send your responses to J jhk@saturn.acc.com if you'd like.
Thanks.

original text follows: -----------8<-------------8<-----------------

Gentlemen;

I did not see the text of the original message, but I'm wondering if you've found a solution to a symptom that I've been hearing while trying to operate mobile hf ssb.

This past summer I installed a 15 meter monoband transceiver in my 1985 Chrysler Laser Turbo XT. I immediately noticed that when the engine was running my overall background noise level went up to nearly "half-scale" across the entire band (21-21.450 mhz). This is not ignition or alternator noise; they have distinctive sounds that I've heard in my other vehicles. I do have an all electronic dash, but that noise is generally deterministic (e.g., happens at specific places across the spectrum) while this is very, very broadband, and has no "note" component to the sound. I do have quite a bad birdie from the dash at 21.336, but other than that this broadband hash covers up anything of a lower level.

I did try operating the radio from sealed lead-acid batteries to see if the noise was conducted, and it had absolutely no effect on the level of the noise. It also appears to be entering through the antenna connector, since it disappears when the coax is disconnected (so does any desired signal, too, of course!). I had someone mention a couple of weeks ago that it might be the fuel pump. I suppose that is possible because it looks like a small DC permanent magnet motor (with brushes, I presume) pressurizes the electronic fuel injection system when the engine is running. My only other "first suspicion" is the injectors themselves, although they are inductive and I'd think this would end up being conducted rather than radiated. Does any of this sound similar to the problems you were having or have solved?

Now, let me put a strange twist to the story. I've noticed that this noise, or a similar one that may be masked by the former one, *increases* noticeably when I am driving on concrete highways versus blacktop asphalt! The only thing that I can ascribe this to (if it is indeed the same noise generator) is that the car is somewhat better grounded through the tires to the asphalt surface than to the concrete (asphalt = tar = carbon black = "relatively" conductive surface vs. concrete = silicon = insulator). I use very low profile, very soft compound (lots of carbon black) tires (hey, it is a sports car, after all!). Anyhow, it *is* strange. I have heard of "tire static" in some old handbooks, but of course the wideband noise is there whether the car is rolling or not. Interestingly, also is the fact that the turn signals "modulate" the amplitude of the noise. Very strange.

I have the shop manuals on the car, which shows that the fuel pump

is on the top of the gas tank. It appears that the first place that
I could attempt to easily bypass it is under the rear seat. I'd
like to do it at the source, but that may not be physically
possible.   If I could just get the noise down 15-20 db, that
would probably be plenty. I'd appreciate any info if this sounds
remotely familiar to your situation. Thanks much, and reply by
email, fax or phone is fine.

John...

Glenn, is that the only MAR-x that's "just like" an Avantek part? If not,
is there such a thing as a MSA-to-MAR cross reference?

|>as a "lid" is just what I need.

An interesting question. I read what Kenwood had to say in the TS-440 manual
and eventually got on the air and asked some people to comment on my signal as I
adjusted the the controls. Typically (hey, Derek, did I spell that right? I

can't spell check in the editor with my system.) they reported the best signal with my ALC meter well past the fat red zone. That left me wondering if Kenwood meant that I shouldn't exceed the fat red zone or the little red line that ran under it (which I assumed was purely decorative.) The signal with no bounce in the meter at all, or bounce kept in the "pre-fat red zone" area was described as "awful" and "muddy" even with the processor on.

What's a ham to do?

Ptui.

I'd rather use "it" than something like that. Although it's probably easy to re-write the text to avoid the question completely "Patrick Taber, Operator of station KC1TD has provided satisfactory evidence of having met the incredibly low criteria of the Worked All Day Award." works for me just as well as it would for Patricia Taber (ignoring the callsign.)

I don't think there was any sinister purpose in the wording of the awards. In some cases it was thoughtlessness, and in others it was probably blissful ignorance that a problem existed. Countries where English isn't the native language probably still use the 50-year-old english textbooks (some of which still teach the use of "thou") and it wouldn't occur to them to question the assertion that proper English always uses "he/him/his" when the sex of the person spoken about is unknown. Paired with the custom of assigning gender to words in many languages it would probably never occur to those people that there might be something controversial.

First we need to solve the problem (neuter pronouns) then we need to change the text books. Then we have to wait the 100 years or so for it to propagate.

Yes you are expecting too much. :-) Seriously, you could carefully
retune the frontend to favor the lower frequency range. This would
probably make it impossible to monitor National Weather, but if
aircraft frequencies are important enough to you, it might be worth
it. Life is a compromise.

You don't really need A/D. You just need to put a level sensor in the audio line -- goes high when the audio exceeds some threshold you set to remove the noise. An op amp circuit should be able to handle that pretty easily. Then you have to write software that will calculate the signal high to signal low time and figure out what's dots and what's dashes. Not as trivial as it sounds with hand-sent code, though you'll get a better hit rate off people who are using keyers than straight keys or bugs.

VVV was also a CW test signal during WWII (V for Victory, like the first three notes of Beethoven's 5th Symphony). Wonder what the Germans and Japanese used?

RYRYRY in baudot is a "worst case" test pattern which exercises all the bits alternately; the ascii equivalent is U*U*U*. Perhaps they are more relevant to mechanical teletypes.

Hey, no problem! I may have struggled terribly hacking my way to 18 wpm, I've been stuck there for 25 years :-(, but I can appreciate that others have found their ham radio niche in working CW. I hope people understand that I have only railed against those with a holier-than-thou attitude that one is not a serious ham unless one can do high speed CW and those who claim that CW is the most efficent communications modulation. I don't believe either of these claims and will probably jump in again if I see them come down the net.

Now while we're on the subject of CW, I've come to realize that one of the problems I have copying CW is that I am unable to write faster than 18 wpm with pencil and paper and that I can't copy at all in my head. I have tended to believe over the years that some musical talent must be required to master high speed CW since most of my ham friends who can do high speed CW play a musical instrument. I have read lately on the net that some people with no musical ability at all have mastered high speed CW. Ok, what's the secret besides practice? I've practiced both on air and off for years with no improvement. How do you copy in your head? Even after all these years, I have to concentrate so hard on each letter sound that

I can't keep the words in memory. To find out what I just copied, I have to go back and read the paper. Anybody got any hints for a ham who is eligible for the QCWA who can not break the barrier?

ALC means Automatic Level Control. A meter indication in the normal operating range does not mean you are splattering, but that the ALC is operating properly. If the meter isn't moving at all, the output power will probably be far less than the capability of the transmitter. Adjust the mic gain for a meter reading in the normal range, but be careful not to exceed that range on voice peaks. There is some evidence that the 440 is quite unforgiving when overdriven.

> specific one down people's throats?

WAIT NOT LONGER.....I'm suprised that none of the old-fart beat me to it!!!

What is so SPECIAL about CW....

1) EFFICIENT. CW is conservative of band spectrum. CW is "THE" QRP mode. CW is "fault-tolerant" as a digital mode. The good old gray-matter processor still beats the best CPU algorithm ever written for pulling meaning out of the mud.

2) SIMPLICITY. CW is the simplest form of communications to build a transmitter or receiver for. New hams can be encouraged to build their own equipment for CW without intimidation or excessive cost. In the event of an EXTREME emergency, this is the easiest mode to "Improvise-and-communicate" with. CW requires no modulation, modems, software, ...

3) FRIENDLY. CW at 15wpm+ lopes along at an easy conversational pace allowing one to think of something interesting to say while sending. CW even has a parallel to the smiley .... .. CW may be used by the speech impaired, sight impaired, and the hearing impaired equally without extensive adaptation. It is difficult to scream, rant, or rave in CW.

4) HISTORIC. (this is where the flames will come from ;-) Samuel Morse and his code have been historically significant to the evolution of Amateur radio. It is also the only digital

mode easily recognized by non-amateurs in movies etc. CW has its roots in pre-telephone telegraph communications. How can children play "cowboys-&-Indians" without a rail-road telegraph operator??

5) REWARDING. Communicating via CW is a "SKILL" and thus rewards the operator with a sense of accomplishment and satisfaction.

Numbers 3 and 5 are my personal favorites. The simplicity of home-brewing CW gear should be particularly important to all those who are looking for various ways of enticing younger future old-farts into the hobby. If you've ever built your own gear and made a contact with it......you would know what I mean.

KM4JN, middle-aged-old-fart-that-does-not-oppose-the-communicator-class but-KNOWS-somehow-it-will-not-acheive-the-expected-results-and probably-WILL-cause-insurmountable-problems-for-the-future,

Herbi (smileys implied).

What? One minute solid copy or answering 7 of 10 multiple guess questions on received text is a test of on-the-air procedures? I hope not!

>CW is probably more common to all amateurs than any other particular

>"watering hole" where the packeteers can meet the FSTVers.

CW is a MODULATION method not a LANGUAGE! Whatever language you choose may be encoded into CW. You may communicate in the Spanish LANGUAGE via CW modulation for example. If you mean a common MODULATION method, then consider AM or FM. They're certainly simple enough to receive or generate and every ham should understand the principle. A separate test on talking and listening might be a good way to test on-the-air procedures. :-)

When CW was the only modulation method, many hams and commercial radio users were feverishly experimenting to develop voice communications. When voice modulation became available many hams and most commercial users switched over because of the increased speed of communications and the ability to detect subtle nuances of tone and expression that it allowed. CW still has a place in the radio hobby because some find it fun to use a traditional mode emulating the way their ancestors communicated. Additionally CW allows cheap weak signal play for the DX game. For serious professional weak signal work such as is done by the Deep Space Network other techniques are used. CW is as valid a modulation method as AM or FM and deserves as much attention on the exam as AM or FM modulation receives.

Hi Bruce,

Yes, it was your comment I was reading. Sorry if I misinterpretted your intention. I think I understand it now. I'm wondering why the VEs don't normally go over the test with interested examinees? Is it because a lot of people just don't care whether they missed a few as long as they pass, or is it because it's always crowded during these sessions and it would be a zoo if everybody wanted to go over their papers in detail?

I really do like the VE program. When I took the General in 1963, I was still wet behind the ears and going to the FCC office in San Fran for the code and theory was a little intimidating. This is a much better system and if I can contribute to its success, I would like to do so.

Thanks again, Bruce,

$390 Yep, the difference between a man and a boy is the price of his toys. :-)

>I'm wondering, also, if you can have a few hundred feet of control cable
>before the meters become inaccurate.

I'm using 100 feet of control cable with no problem. The power wires are
14 gauge and the other wires are 18 gauge. The wire has a fixed resistence
and the sense current is small so, other than the original calibration routine,
the length of the cable should be unimportant.

Three cheers for those "paragons of patience!" I finally met one last week. I've been licensed for one year now and had given up CW after the first month of nothing but frustrating contacts with people who invariably sent faster than I could receive.

So here's the challenge to all of you OFs with Extra tickets who aren't yet as jaded as Perry: <<-- joke alert, joke alert :-)

If CW is really so neat and fun and worthy, then getcher VFO into the novice sub-bands, turn off your Kilowatt (still illegal in all novice sub-bands except 10m, no?), crank your keyer down into the "barely endurable" 5wpm range and answer the slowest, most slimy, most despicable, most awkward CQ you can find. Is he in the same state? Hey! That's great! That means he won't have any trouble picking your signal out of the noise! Does he send "RST 603"? Even better! Now you KNOW your talking to a real beginner! :-)

Thanks to those of you who actually do this once in a while. Running into one of you sure changed my view of CW. (Yes, I still consider it archaic, but I now allow for the possibility of it being fun too.)

```

Nope! The fence is not high enough for the drive-in movie, and the
people at the next table should just sut-up and stop all the acoustical
interference. :-)

I have a 440 and a 950. I do remember clearly that the TS-440 manual says
that the Mic gain should be adjusted such that voice peaks do not exceed
the ALC area marked by the red bar.

I think the source of confusion is that what I recall reading in one of the ARRL study guides (maybe the Tech book) that Mic gain should be adjusted for "slight" ALC meter movement. "slight" in not a quantative term.

In SSB your output signal is dependent on the modulation. For example, no audio - no transmitter output. Put a 1-2 Khz pure sine wave in through the Mic jack (at the proper level) and you'll see "full power". Using an external wattmeter I usually see about 90-95 watts out with the sine wave. Voice is a different matter. I usually see about 45 watts out avg. for my speaking voice. Your mileage may vary.

If you don't crank up the Mic gain such that you peak the ALC meter at the end of ALC zone you will be putting out some power but not full power.

I usually run my TS-440S and Kenwood TS-950S with Mic gain / processor levels peaking the ALC meter at the end of the marked zones. This gives me full power out and, from signal reports, no voice distortion.

==> One thing I dont like about the 440 is that it has no "power" control. The TS-140s and the TS-950s both have this control and it is useful for "powering down" after I've established a QSO after a CQ.

You can probably accomplish the same thing "powering down" on the 440 by reducing the Mic gain. But, I don't think its the same "mechanism" the 140 and the 950 use to control power output. Maybe someone can give me the scoop on this...

> The guys on-air said, "The [ALC] meter. . .
>needle shouldn't move at all. If it does you're going to splatter."

If short, I think the guys on the air are "wong". It will work, but you wont be driving the TS-440 to its 100 Watts rated output.

Gary

Makes you not want to even buy a house.

But I bet you will likely find a correlation between lots of CCR's and
the existance of a home owners association you have to take part in.

When telling a real estate agent about your restrictions on a house
search, you could mention that you don't want to be involved in any
home owners associations as a condition of the sale, due to the legal
obligations that gives you. The agent may be able to effectively
select property better suited to hams (if there is any) without ever
knowing exactly what particular CCR you are trying to avoid (in case
you'd rather not get into explaining it).

Actually it is ages old. It started simply as agreement terms between
buyer and seller, and I suspect early on the terms explicitely worded
that the buyer was obligated to pass on all the terms to the next buyer.
It was probably subsequent to that that the courts (or whoever) established
the concept of them running with the land, to simplify all the terms.

Isn't this a non-existant place that Don Miller allegedly went to
(or didn't go to) around 1966? I think later on his operation there
was alleged to be bogus.

Maybe it's near Suitland Island! (/KH7S)

The Drake SP-7 speech processor, while styled to match the TR-7, will work with any SSB rig since it just plugs into the mic jack. It converts the audio to 455 kHz IF, clips and filters, and converts back to audio at the output.

>FCC Rules part 97.205 paragraph E sentence #2
>(e) ..."Limiting the use of a repeater to only certain user stations is
>permissible."

>Self explanatory.

But it does not necessarily have a unique interpretation. To me this rules says that if you implement means to prevent my access to your repeater, that you will not be in violation of FCC rules.

However if you put a CTCSS squelch on the input, have you actually implemented such a mechanism of closure? I think not, since CTCSS encoders are prevalent, and the number of codes is so small (38). You could try an unusual tone or maybe DTMF to bring the machine up.

How about Data's computer access code from ST:TNG? I didn't get it recorded, so you could effectively keep me out for a few days.

>If the front panel switch was turned off on the repeater, and you drove
>up the hill and turned it on, you would have also made the system "NOT
>CLOSED" for you... His intent there is that the repeater not be used
>also by you, or in this case anyone else. If your definition of a

>PL, Touch Tone, digital squelch or whatever system implemented to hinder
>unauthorized use.

But we don't agree on this. Has there been any case law that defines the proper interpretation of 97.205(e)(2)?

Actually, I probably do agree with you that someone getting into a repeater that they are not welcome on is bad, but I do not see where it is illegal. I would be willing to work with you in rewriting the rules to change this.

There is also another argument to deal with as well. In certain areas, even the 70cm band is "full" with regard to coordination yet nearly all of the coordinations are to repeaters that make virtual very little use of the spectrum by virtual of their closedness (to a group that is).

Perhaps it would be a good idea to go back to the band planning process and designate portions of the repeater subbands for the various kinds of repeaters. At least 1/2 of the 70cm repeater subbands should be available to repeater operators running open repeaters. The term "open" in this context can still mean "with access" controls, but that those who can get the access can be anyone (we want to keep out the LIDs, right?).

>Agreed. And if a repeater is operating out of coordinated band plans,
>it must accept the consequences. And people operating in the repeater
>sub-bands, say simplex on a coordinated repeater output, also must accept
>that a repeater may key up on top of them.

Agreed.

>Or all those who are dissatisfied with what's on 70cm, move to 23cm...

Actually all this is really a problem of what amateur spectrum is for,
and where coordinators derive there authority to make decisions that affect
far more than just repeater owners (such as would be repeater owners because
the coordinators "filled" the band up with such waste as a bunch of repeaters
that hardly get any use).

The fact that 2x1 calls for Extra are running out is a concern. These are the incentives to upgrade to Extra:

1. Extra privileges on HF
2. Space operation privileges
3. Nice callsign

My response to these:

1. So what, I don't work HF.
2. Everyone gets a waiver anyway.
3. This is all that's left.

So why don't I hurry up and just get my Extra right now? For one thing I only have so much of my time to spend on ham radio and it goes for the "codefree" fight which is not over. Secondly, with the threat from the FCC that the Technician class may be an extinct one, I am going to hold onto mine until the outcome.

What we need is for the FCC to start recycling unassigned calls.

>with its 20 MHz split).

Icom does make that repeater available with a 12 MHz split.

The bandplan that is appropriate is of course the local one. The ARRL national one is a suggested starting point. Local needs do vary and so the local bandplans vary as well.

>>The PROBLEM is that there are many (and this may be MOST of them) closed
>>repeaters are just there to serve a clique. They get very little use.

>That seemed to be the case out in nineland, but not here. It really depends
>on the size of the group that runs the closed repeater. Given the ham
>population density, we tend to see far more people on our closed machines
>out here.

When I visited 6 land, I found FAR LESS usage of all the repeaters. I guess everyone was hiding on the closed repeaters and simplex frequencies.

>>I don't want to eliminate the idea of a closed repeater. There is a place
>>for closed repeaters. But I think there are too many of them around right
>>now in the 70cm band.

>Probably due to all of those surplus Mastr IIs and Micors. 2m in Chicago
>is heavily PL'd, as I recall.

PL/CTCSS does not consitute a closed repeater. CTCSS is useful to block out intereference. The 146.76 machine in Chicago recently became PL'd, so that means everyone who gets in has to have that PL tone on. That gives us a chance here in Urbana-Champaign to end our problems with their high power users and band openings by putting on an anti-PL for the same tone. So if the that tone is present, WE WON'T key up.

>>All "clique repeaters" should move to 23cm.

>Odd. Stanford runs an open repeater on that band (1291.5 -20M, 88.5Hz, W6YX/R)
>so I'm not too sure I agree with you. I did argue the case for keeping it
>open (not that there was much opposition), given the nature of the club,
>and of the band. We went "up there" in part to publicize the band, and
>I don't think that would have worked in the case of a closed repeater.

CTCSS controlled and open. Yes, it takes an open repeater to really contribute to activating a band.

My concern is where all the Communicators will go. If they get 2m and 6m then they get distributed out better. If they are stuffed above 220 MHz, then expect some major problems on 70cm. But if you can encourage them to jump all the way to 23cm, great.

>Personally, I'd like to see open repeaters as the default, but over the years,
>I've come to sympathize with others who get tired of having their conversation
>disrupted by some bozo with a nebulous comment. Also, smaller repeater
>communities mean that I can keep my radio on at my desk; chances are that
>when someone comes on, I'd actually want to talk to them.

An "open" repeater does not mean there cannot be access controls. You can put on those controls, and then tell MOST people how to access. Just don't tell the BOZO's. Of course CTCSS is not it.

>In the end, both open and closed repeater systems have their merits, and
>the decision to close a repeater depends on the nature of the repeater
>community; only the trustee is in a position to make that judgement.

With the above definition of "open", I would suggest amending the band plan to provide for some portion of the repeater segment to be "all open only".

I have to throw my $0.02 worth in on this one. I think the VVV on CW
was/is to help operators get the dot/dash ratio correct. The old
semi-automatic keyers (a.k.a. 'bugs') send dits automatically but the
dahs have to be keyed manually. Since the correct length far a dah is
three dits, a V is a good character to use to get the ratio correct.
These days, electronic keyers do it all for you, although I have heard
lots of CW ops who seem to somehow have screwed it up.

COMOROS, D68. D68VT, OPERATED BY K5VT AND N6ZV DURING OCTOBER 23 TO 31, WILL BE LOOKING FOR YOU ON 9 BANDS, 160 THROUGH 10 METERS PLUS AO 13. DL7FT IS DUE IN D68 SOON. D68WB SKEDS HIS QSL MANAGER WV4F ON 14152 KHZ AT 0330 UTC DAILY.

EAST KIRIBATI, T32. T32IO OPERTIONS FOR OCTOBER HAVE BEEN CANCELLED.

JUAN FERNANDEZ, CE0Z. IF YOU CAN NOT WAIT TO WORK CE0ZZZ NOVEMBER 10 TO 18, LOOK FOR CE0ZIG WHO LIKES 17 AND 12 METERS AROUND 2200 UTC.

KERGUELEN ISLAND, FT8X. FT8XA LIKES 14256 KHZ AFTER 0000 UTC AND 14015 KHZ AROUND 0400 UTC. RAFIK WILL WORK ALL BANDS IN THE CQWW SSB CONTEST THIS WEEKEND. QSL VIA FD6ITD. FT4XG IS FREQUENTLY FOUND ON 10 METERS AT 1200 UTC. QSL VIA F1AAS.

LIECHTENSTEIN, HB0. HB0NL MAY BE FOUND ON 7005 KHZ AT 0100 UTC AND 14020 AND 21015 KHZ AFTER 1300 UTC. QSL VIA HB9NL.

MALAGASY REPUBLIC, 5R8. IK2GNW WILL ATTEMPT TO ACTIVATE 5R8 BEFORE THE END OF THE YEAR. DL7FT IS REPORTED TO BE HEADED TO 5R8 AFTER THE D68 OPERATION. K5VT, EX 5R8VT IS NOW IN D68. LLOYD AND IRIS PLAN A

VISIT THERE AS WELL. THE MALAGASY PTT WILL BE VERY BUSY NEXT MONTH.

MARIANA ISLANDS, KH0. THE JCCC BOYS PLAN TO SET A NEW OCEANIA MULTI MULTI RECORD IN THE CQWW SSB CONTEST THIS WEEKEND. SIGNING KH0AM, 14 OPERATORS WITH 7 COMPLETE STATIONS WANT TO QSO YOU ON AS MANY BANDS AS POSSIBLE. RTTY AND CW OPERATION WILL TAKE PLACE BEFORE AND AFTER THE CONTEST. QSL VIA JE1CKA. PLEASE SIGN YOUR FULL CALLSIGN, ONE TIME ONLY. KNOW YOUR WAZ ZONE NUMBER.

MALPELO, HK0. HK0TU OPERATIONS ARE ON SCHEDULE FOR NOVEMBER 3 TO 8. SIX BANDS WITH 20 OPERATORS WORKING CW, SSB AND RTTY. QSL VIA HK3DDD.

MOZAMBIQUE, C9. C9QL HAS BEEN ACTIVE ON 10, 15 AND 20 METERS. LLOYD AND IRIS WILL REMAIN THERE UNTIL NOVEMBER 5. WB0NAA WILL BE STATIONED THERE UNTIL JUNE, 1992. SO FAR, JIM HAS HAD NO LUCK IN SECURING A LICENSE.

ST. PAUL ISLAND, CY0. AFTER 2 DAYS DELAY IN LANDING, DUE TO HIGH SEAS, PATRICK AND RON ARE QRV AS CY9CF. THEY WILL BE ACTIVE ON 9 BANDS, 160 THROUGH 10 METERS ON SSB AND CW. THEY WILL OPERATE RTTY ON 15 AND 20 METERS ONLY. QSL VIA FP5DX.

SOUTH GEORGIA, VP8. VP8CDJ IS OPERATING 20 METER SSB ON 14255 KHZ FROM 2300 TO 0000 UTC. QSL VIA GM4KKO.

SOUTH SANDWICH, VP8. VP8SSI BY WA4AQS AND COMPANY HAS BEEN CANCELLED FOR THIS YEAR. TRANSPORTATION COSTS HAVE GONE UP 25 PERCENT DUE TO RISING FUEL PRICES. THE SHIPPING COMPANY HAS RETURNED THEIR UNCASHED CHECK. TRANSPORTATION ALTERNATIVES ARE SLIM TO NONE FOR THIS YEARS SHORT ANTARCTIC SUMMER.

TONGA, A35. A35XK IS QRV. QSL VIA WA6ZEF.

USSR, UA0K. UA0HAE/UA0K OPERATING FROM WRANGEL ISLAND IS QRV ON 14020 AND 21015 KHZ. QSL VIA UB4MM.

WAKE ISLAND, KH9. AA4NP/AH9 IS NOW QRT. AH9AC HAS BEEN WORKED ON 14226 KHZ AT 1030 UTC.

WEST KIRIBATI, T30. T30JH, BY JACK, VK2GJH IS QRV. TRY 28520 KHZ AFTER 2200 UTC OR 14222 KHZ AT 0400 UTC. AR

I didn't say there were not any such clubs. Notice that I did include
the clause to refer to such things.

A better name is "The Scam". That sounds just like what it is. Hmmm,
it even sounds just the same as one of those churches I hear about every
now and then that takes people's money. Clearly it is just some people
who are power hungry and starving.

Sorry about you losing your $25. We've all made mistakes in life even
where we had no way of knowing in advance. But $25 is a cheap lesson
on how a lot of other people live.

You can copy code that is 20db BELOW the noise floor?

>2) SIMPLICITY. CW is the simplest form of communications to build a

Very very few people who use the frequencies I use have any equipment that
can copy it. Just try building a rig that can transmit CW in such a way
that any of the radios other than my R-7000 can copy it. All my other
radios use just FM.

>3) FRIENDLY. CW at 15wpm+ lopes along at an easy conversational pace

Thus is a good argument in favor of using CW. With arguments like this,
we don't need a code test at all for any class license. Everyone will
be flocking to use this wonderful mode where everyone has something
intelligent to say, and there are no screams, rants, or raves.

>4) HISTORIC. (this is where the flames will come from ;-) Samuel Morse

Didn't Samuel Morse predict that there would be a telegraph key in every
home with 50 or 100 years? Hmmm. I guess people just like the phone better.

>5) REWARDING. Communicating via CW is a "SKILL" and thus rewards the
>   operator with a sense of accomplishment and satisfaction.

Yes, it is rewarding. Too bad I didn't get to realize this while studying
to pass a test that was being forced upon me. Too bad lots of non-hams
will never even be exposed to the possibility that they might even like
code, just because they won't get into ham radio until it sheds itself of
irrelevant tests.

>   KM4JN, middle-aged-old-fart-that-does-not-oppose-the-communicator-class

>   probably-WILL-cause-insurmountable-problems-for-the-future,

That's why I petitioned, and commented, to the FCC for a different structure
of codefree license classes, as the Communicator did not really address the
problems, and the FCC proposal appears to be trying to destroy ham radio (and
get a few hundred MHz of free spectrum to sell as well).

I think what is meant here is that CW is more than just English or Spanish. There are a number of coded abbreviations, Q codes, and other things, that can help the communication process. You actually can carry on a QSO with another station without having to have the understanding of the other voice language. And of course the accents are gone (unless you consider fist).

>When CW was the only modulation method, many hams and commercial radio

CW definitely has its place in ham radio. But as long as it is required of all hams, ham radio itself may not have a place in the spectrum.

I just bought an ICOM IC-24AT 144/440 HT and am enjoying it a lot. I'm told that there's an (undocumented) way to program it to increase the VFO range and also to make it possible to tune in 10 and 100 MHz increments. The instructions I was given are:

```
From power off, hold down              then turn radio on to enable
=========================              ============================
```

LIGHT, B, 3	extended VFO range
LIGHT, 2	10 MHz tuning increments
LIGHT, 3	100 MHz tuning increments

Unfortunately, nothing changes when I try these! Has ICOM removed this goody in the latest units they're shipping, or am I just not doing it right? Anybody know?

Thanks,

Aaron

I just came accross a Hammarlund HQ-129-X tube transceiver and I don't have any specs on it. If anyone has a schematic or manual for this radio I would appreciate getting a copy of some of the more inportant info, but I'm not willing to put a lot of money into it (more than a reasanable shipping and copy cost) since I may be giving it eventually away to a good home.

Thanx..   KA8NAR

Subj: SONY ICFSW7600 radio
I just bought a new SW radio in Hong Kong a few weeks ago. It is made by SONY and has the model number ICF-SW7600. It appears although I am not sure to the the replacement for the fairly well known model ICF-7600D which has been around for a few years now since it is about the same size and appears to have similar capabilities. However this radio from a features point of view at least has several nice improvements over the ICF-7600D that I wished it had since I have owned one of these for several years.

These are what the new radio has that the 7600D did not.
1) BFO for USB and LSB.
2) On FM you get stereo(!) on the phones. Not on the internal speaker since there is only one.
3) It has a dial light that stays illuminated for about 15s after pressing it.
4) It has a well deswigned pull out stand on the back which lets it rest at a very convenient angle for use (very stable too).
5) It has a lock feature which disables key presses.

All these are improvements over the 7600D.

Performance wise. I have not tested it closely but at first sight and after having it for several weeks now I would say it is about as capable as the 7600D.

Cost me US$165.00

Well, Panama has rights to the "HO" (that's oh, not zero) prefix, so I suppose they'd have dibs on this callsign.

But more importantly, Robert's posting gives me the opportunity to mention another cute radio station name I encountered recently. As KA9Q and I were in line for Star Tours at Disneyland last week, he pointed out that one of the manufacturing robots was listening to K-DROID. I think the frequency was 109.7. Guess they have a different band plan on Endor. :-)

hello Randall,

Welcome to the world of radio.

Just because you think that CW is not "a medium that is suited to mobile operation". does not qualify it as a fact, nor is it a reason for its lack of popularity. I have a mobile hf rig and my log shows almost 80% CW contacts. I find CW is a digital mode with a low data rate that is easy not as prone to noise interferance as is any type of phone communication. Sending CW is VERY easy with a keyer and again there is no mobile noise. And finially CW is easy to copy if you take the time to learn it.

Ah ha maybe that is the reason for all the code bashing, it isn't hard in itself, but it takes time and dedication to learn to use it as well as we use our mouths. Time and dedication are two things that (some, a few, most [insert your favorite]) people are not willing to devote to anything. It is easier to be lazy. The reason for the no code licence is to allow those with no interest in CW to participate in the parts of amateur radio that don't make use of code. I have no problem with that, however, dont you dare suggest that cw operation is simply part of a bye gone era. It happens to be the most enjoyable part of this bloody hobby for many of us. CW is not less popular, the CW bands are just as crowded as the SSB bands and the bandwith of a CW signal is less than that of a side band signal! So before you get off suggesting in an open forum that CW is not popular and that In the future it will continue to "decline in popularity" because "times are a-changin" I strongly suggest you pull your head out of the sand and look at what you are saying. If we, any part of the amateur community begins suggesting that we do not "need" a portion of our treasured frequency space then we will have it taken away by someone who can demonstrate a "need". I am an advocate of anything that is Pro-ham, I don't care if it is code or no code. As long as it does not even hint at the possibliliy or render a suggestion that something may be taken away from us and not be missed.

Someone on the net posted a Mod for the 24SAT and mentioned something about if the HT is of the earlier versions, in addition to the keyboard sequence reset, a diode had to be removed. The Keyboard sequence alone din **not** work. Does someone on the digest know exactly what diode has to be clipped ?? Any help on the matter is appreciated.
73,
Rich

>
>I wouldn't have thought so either, but...

Ditto reports of "mobile" during CW contacts. They are out there, you
just have to listen (at 20 wpm :-o) for them !

The relative inefficiency of mobile antennas on the lower frequency
bands also gives CW an advantage over SSB. The radiation resistance of
an 8' whip on 80 meters is less than one ohm. This pretty much wipes
out your transmitter's 100 watts. The receiver is unchanged, because
the signal and noise are both attenuated equally.

>I am studying for my ham license, but I am confused by grounding.
>
>What is the difference between RF ground and electrical ground?

RF resonates wires whose length is an integral multiple of a quarter wavelength. If you DC-grounded a transmitter with a resonant wire, the average (DC) voltage of the transmitter would indeed be zero.

One other cute trick of transmission lines is that short circuits become open circuits at each quarter wavelength. If you've grounded one end of the line, then it's an open circuit one quarter wavelength away. Poof. No ground. (This is Smith Chart magic - ask an EE prof.)

>What kind of problems can arise if you have an electrical ground but
>not an RF ground?

Your transmitter/coax/whatever will have RF on it. In small quantities, this is no big deal. I've been bitten by RF before - it burns small holes in your skin. Smells bad. The other problem is that it couples with nearby objects, like your cat, which makes tuning impossible. It can also annoy the cat. If you don't have a cat, think about your neighbor's TV instead.

>I know how to construct an electrical ground, but how do you construct
>an RF ground?

An RF ground is usually either a short (<<1/4 wavelength), or otherwise non-resonant wire. For multi-band operation far from a Real(tm) ground, several different lengths are used to connect the transmitter to ground. If any one of them is a short circuit, zero ohms in parallel with anything is still zero ohms.

>Finally, I see that MFJ sells an artifical RF ground box. How does one
>connect that? I.e., if you connect an electrical ground to the ground
>terminal of a transceiver, where does the RF ground connect (and I
>guess, what does it do)?

The artificial RF ground puts the RF onto a length of wire, rather than onto your transmitter chassis. It sets up an equal and opposite current in the wire, cancelling out the RF that was on the transmitter case.

The electrical ground is needed for 60 Hz safety. The RF ground is
needed for RF safety. Put both the electrical ground and RF ground on
the same ground terminal of the transmitter. I'm not sure about MFJ's
version - consult the owner's manual.

>Many thanks.

No problem. Hope you get your license soon. Good luck !

Re: un-netting

Is the procedure to call "CQ Usenet" ?

I've found that 28.400 +/- 10 is almost always in use on a busy day. Probably something to do with converted CBs, or digital readouts and our love of 10.000000000.

Maybe 28.400 +/- 7.5 would work better. Could we ever remember it, though ? Actually, I'd rather use something far, far, far away from 28.400 which is the Tech's version of 14.313.

There was an article in one of the last Ham Radio (snif) editions. It described converting a TV LPDA to a 5-element 2 meter Yagi. I took it at face value and did it. Worked (sorta). I looked at some other equations, scaled for the different element diameter, and now have an operational 2 meter Yagi.

Yagis are a little squirrelly around metal objects, so maybe the answer is to leave it an LPDA, but prune it for 2 meters.

In Holland, some people have similar restrictions, but usually these can be
settled via the Geneva Human Convention, which explicitely allows the freedom
of communication.
I _think_ the USA also signed this; why doesn't this trick work there?

Oh yes, it has its problems: I remember a case where the government,
represented by two people, one of which said to be the 'technical
knowledgable'. They both looked to the equipment, and then the techie
asked why the cable television network isn't usable....

>C-64? Get real.
>--
>Julian Macassey, n6are julian@bongo.info.com ucla-an!denwa!bongo!julian

I take your point that CW may not be everyone's interest. The conclusion, however, does not follow that CW should not be an entry requirement. Think for a moment about what the CW requirement is, in general terms: it is a test of on-the-air procedures. This sense has been lost somewhat since the elimination of the transmitting test.

So, what should take its place ? More technical exams would ensure we have lots of techies that don't know procedure. Giving, say, an RTTY test would then generate no-RTTYers, complaints that RTTY is obsolete, etc. Because amateur radio is so varied, an operations test on any particular mode would generate grousing from other groups. Giving several different operations tests would be a VE's nightmare.

CW is probably more common to all amateurs than any other particular mode. One could argue that this is *because* of the international CW requirement. Yup, that's right. Think of CW as having the same function in amateur radio as American English has in the US. It's the "watering hole" where the packeteers can meet the FSTVers.

So, I suppose it is up to the no-coders: suggest an operations test that is common to all amateurs. Any high school graduate can pass multiple choice pencil-and-paper tests.

A note on J-poles made of copper pipe -

A friend of mine used 1/2" pipe, while I used some 1" that was lying around. The bandwidth of the 1" version was VERY wide. It also works well on the CAP and Marine band frequencies for you multi-service users.

>1. How much power could one push into this when made out of twinlead?
>Would 5 watts be OK? How about 10?

I suppose you could put power into it until it got hot, probably where the coax attaches to the matching section. 5-10 watts is fine.

>2. How do you tune it? Trim the top?

I posted tuning instructions - they went somewhere. Trim the top to shift the curve upward in frequency, probe the matching section to shift the curve up/down on the resonant frequency.

>3. Can you build this upside down? I.E. Feed it from the top, weight the
>bottom, and hang it out the window by the coax?

Sure. Just be sure it doesn't hang next to large metal objects.

If the transmission is heard, it is intentional interference. If the transmission is not heard, it is not an ID.

Ever hear a "roundtable ID" ? This is where one guy realizes the 7 minutes is up and IDs. Everyone then IDs simultaneously. Try picking a callsign out of that !

I've had batteries go out on the HT before. Embarrassing. Luckily, our local OO is a real human, and would probably overlook it unless it starts happening very often to particular stations. I suppose if the FCC or the local OO finds out and issues a "Notice of <whatever>", you could say that you are rectifying the problem by getting a spare battery.

I live in a small subdivision (10 parcels) of 2.3 acre lots. The subdivider was legally compelled by the county government to establish CC&R's for the subdivision. They were *limited*, however.

The county required the CC&R's *only* for road maintenance and for fire hydrant water storage. All other CC&R's were voluntary and we have many.

Many of them have been ignored. We have 'em for weed height (8" max.), one that specifies "white, 3 rail fencing", and lots of other real picky stuff that the original subdivider thought would be "nice".

The subdivider is long gone and nearly all of the CC&R's have been ignored by one neighbor or another (only a 4 year old subdivision).

We have intentionally ignored the CC&R's with exception of the legally required by county items. I too have been told of "abandonment" of the CC&R's.

I am told that the average lawsuit in Calif. for a CC&R violation averages $55,000. We have no (read "zippo") dollars in our litigation fund. What sane neighbor would want to pay $5.5K to sue another neighbor in our subdivision. You guessed it, none so far. I doubt if greater than two or three would ever attempt such a suit and I am certain that it would be impossible to obtain agreement of any majority to engage in such a lawsuit. Heck, we can't even obtain agreement on how to replace a common irrigation tank!

So, in relatively broke subdivisions, it's unlikely that such a lawsuit would occur, in my opinion. I'll include the standard disclaimer that I am not, and will never be a lawyer.

This situation would probably vary in a larger subdivision where fees are collected and the "homeowner's association" is more active.

We are more concerned with spending our money on better things and if we would ever get together, we'd gut the CC&R's.

Global Positioning Satellite Receivers

I have a friend here in the UK who is currently trying to locate information on Global Positioning Satellite (GPS) Receivers. He believes that there exits a magazine in the US called something like "GPS World" which contains just this sort of information.

If you know of this magazine (or equivalent) or have any information on currently available GPS receivers can you please let me know.

The rotator being discussed was a U110 being used as an elevation rotator. There's a big difference between a U110 and an HD73 for example. The U110 motor is quite small and can easily be stalled with bare hands. The HD73 motor is quite robust and the gearing is substantially stronger. All Alliance rotors aren't alike. While you can TURN a tribander with a U110, you can't elevate a tribander unless you balance it very carefully. I originally used a HD73 for rotation and a U110 for elevation of my satellite antennas. This worked ok for the little Cushcraft antennas, but the big, long KLM antennas would stall the U110 after about 15 degrees of elevation. By mounting small lead fishing weights on the KLM booms, I was able to balance the antennas so that the U110 could elevate them. However, when there was even mild icing of the antennas, they wouldn't elevate reliably. When I switched to the KR500 elevation rotor from Kenpro the problems went away. I switched to the KR5400 combined elevation and azimuth system when lightning got the HD73 and I now swing a KLM22C, a KLM40CX, two Down East Microwave loop yagis and a 4 foot dish with ease. The U110 weighs about 2.5 pounds while the KR500 weighs about 15 pounds as does the Alliance HD73. I am convinced that the extra weight is more than just ballast. When I opened up a U110 to repair the clicker, I found the little slotcar motor and mickey mouse gears quite amusing. This is not a robust system.

|>not?

No, they do not. Because there is no proof that *you* copied the code. That's a requirement for the code tests.

The proficiency certificates require you to send a signed statement that you copied unassisted, but that statement is more to remind you that you're only cheating youself if you cheat. There is nothing to gain by holding a cert. for any given speed, so you only diminish yourself by not doing things on the up-and-up.

most of the japanese duo-banders of current manufacture can be restored to the european band plans by either a special power up sequence, or a diode change or two, like the "dread out of band mods", but it sets it up for limited band, typically 144-146, and 430-440... The u.s. manuals typically show the diode configurations for this action.

What I would do is try a few out, see what I liked, and look in the manual; if the schematic refers to these different models, and shows the diodes for it or the initialization scheme to set it, then its the one to get.

Most will meet this need
Cheers es 73

I bought this unit because of its coverage of the 118-136MHz aircraft
band. It DOES have an AM detector and it DOES receive signals in this
part of the spectrum. I am very happy with its performance in the
144-148MHz band. HOWEVER, below 124 MHz my unit is virtually useless.
If I open the squelch up and sit at the end of the runway at Austin
Mueller, I can hear the ATIS (just barely 119.2).

My question is: does anyone else have anything to report on this
model? Is this typical? I am using a 5/8 wave antenna on my car
and I know it is part of the problem, but as things stand now
this radio is only marginally useful for monitoring these freq.s
(I am trying to be objective...am I expecting too much?)

Any comments/suggestions/help would really be appreciated.

Roman

Anyone know what the law(s) in Texas are regarding the legality
of scanners at the home station and/or in a vehicle? I'm also
wondering about 2M rigs with extended receive which are capable
of copying police and other public service frequencies in a
vehicle. Of specific interest in the Nacogdoches area but the
entire State of Texas would be relevant. We're moving to Nacog.

How good is a certification without a witness??

What is to stop me from recording the 35WPM test and then playing it
back at a slower speed (remember reel-to-reel recorders) or just copying
it with my computer. After all, it is sent by computer, shouldn't have
any problem receiving it the same way.

Do you still wonder why not??

Sr. James Dugal
Agradeco su message em espanol. Mi espanol tambiem es pobre, pero creo ser possible nos comunicar em esta lenguage (mi ingles tambiem es curto).
No soy um radioamador, pero soy interessado em radioamadorismo. Trabajo como professor no Departamiento de Psicologia da Universidad Estadual de Londrina, e recientemente inauguramos una Estacion Radioamadoristica em nuestra Universidad (PY5-UEL). Creo ser la 6@ Universidad del Brasil a tener una estacion desse tipo.
Pero nuestra estacion no esta mui biem equipada. Nuestros equipos son antigos (um TRIO 500 da Kenwood valvulado) e emprestados de los docientes interessado em la estacion.
Em las tercas feras (tuesday) a las 14.00 hs (2.00 PM em el horario de verao/summer do Brasil), hacemos una rodada radioamadoristica de las Universidad del pai's (OC-40m-7130 Khz) e lhe invitamos a hacer parte del grupo.
Gostariamos de saber como funciona esse programa da qual usted es lo coordenador.
Un forte 73

1. Regarding WHO MAKES THE QUESTIONS--

Right, it's NOT the FCC, but the Question Pool Committee which consists of representatives of the VECs (ARRL, W5YI, DeVry, etc)

NOT each individual VEC making up its own, as I read the comment someone (Jim?) made. The VECs all make up their own tests, but all out of the same Question Pool.

This committee meets regularly, and when they change the question pool, (corrections, additions, clarifications) then they issue statements about which tests are no longer valid. VE teams must use exams from the CURRENT question pool.

I don't disagree with what he said, I am restating it. If I misunderstood it, someone else might, too.

2. Regarding bad keys--

We (1) change the key, and (2) advise the VEC, who publish the tests.

Cheers,
Bob WA8YCD

In regard to wide-band gain blocks (e.g. Mini-circuits MAR-_ series), I would suggest substituting the Motorola MWA-0204 or the Avantek MSA-0_04 series. The disadvantage of the MAR- series is that they are very easily damaged if over driven. The damage level is so low that you can burn one out by driving it with the output of another copy of the same model! On the other hand, I have *never* burned out a Motorola or Avantek unit, despite numerous accidents.

I'm not sure if your reference is to me or not, but if it is...read again. I didn't say the VE's were constrained blindly to use the answer key irrespective of its correctness. I said they were not required to go over the exam with the candidate and inform him which questions he missed and what the correct answer was. They are required to notify him of pass or fail and the number he missed. This has been interpreted by many VEC's (who establish the rules on how the exams will be given) as restricting the examiners to giving only that information.

After reading all the postings, pro and con, as regards the no code license I've just gotta add my $.02 worth (as wud any self respecting ham (-;).

I have very mixed feelings re the communicators license. From the traditional viewpoint "if had I to - so shud you" attitude I'm against the no code license. IMHO the no code advocates are sterotypical of the 'me' generation i.e. want it all but aren't willing to work for it.
On the other hand, there is strength in numbers
and if a no code license means an increase in the number of hams then I guess thats good and I'll temper my final opinion with that in mind.

BUT regardless of how the license requirements come out lets knock off the CW bashing! I've talked with hams who have had tickets for 50 years and haven't stroked a CW key for 49 of those 50 years. On the other hand I've also worked hams who very rarely work FM or SSB and wud much rather spend their time on the air doin 35 WPM+. Never forget that amatuer radio is a HOBBY.
A hobby which encompasses many modes of communication only one of which is CW.
To those who advocate a no code ticket I say fine, you're entitled to your opinion, but knock of the CW bashing as justification to support your arguments. To many of us CW is like classical music or fine wine, it takes a while to acquire the taste but once you do, then and only then do you really appreciate the art form.

You can copy GOES satellite photos from HF. They are retransmitted on a regular schedule. To receive it otherwise would entail considerable investment for a suitable receiver - although, you can copy it by connecting a TVRO receiver to an HF receiver.

I use an AEA AVT connected to an Amiga. I get the data direct from the low-orbit APT satellites using a Realistic scanner on 137.xxx MHz. The results are excellent.

Since a receiver is a piece of equipment, is being received without the receiver owner's permission also illegal? ;-) Or does tuning a receiver to a specific frequency constitute permission for anyone transmitting on that freq to be received? ;-) If so, isn't connecting that receiver to a transmitter defacto permission to use the transmitter? ;-)

Seems sort of like someone repaving the street in front of their house and then trying to prevent anyone else from using that street.

This is my signature. It doesn't contain my name at all!

>nobody minds.  K1RH was /1J5 recently from Jekyll Island, wherever the
>heck that is.  But it's not DX either.  I hate it when that happens...
```

I'm not being obnoxious, just confused, . . did you mean 'suffix', the whole prefix/suffix thing in the US baffles me, in England it was easy, there's /A, /P, /M, /MM, and in earlier years /T for the G6/T television stations. Now there's GM0/call etc. in place of the former G5s for guests also. I remember an RadCom article that joked about /V for operation from a volcano!.

But stateside?   A few sign /Mobile, most do not; some W4 stations sign /6 in California others do not. When I first came to the 'States I got annual reciprocal licences (make that licenses) and signed (per instructions) G4NOC/W2; years later in California for some reason others were signing W6/Gcall so I followed suit, not really knowing why. When I came to operate packet I discovered AX-25 doesn't (?) have provision for compound callsigns and using them caused endless confusion.   So I broke down and got myself a K call.

So anyway to return to the subject matter, is the operator of K1RH/1J5 claiming to be Mr./Ms. K1RH in "1J5" land, or do we have someone purporting to be the licencee/see of 1J5 operating K1RH's station?
Moreover, if King Hussain operated my station on CW would he be KK6JR/JY1 or KK6JR/W6/JY1 and if I had recently upgraded to Extra priviledges would that be KK6JR/JY1/AE or KK6JR/AE/JY1 or KK6JR/W6/JY1/AE or what?
I doubt packet radio could cope with say KK6JR/2/W6/G4CAX/AE-15/MOBILE.
I suppose this isn't near to the longest possible callsign as I seem to recall W6ALPHABETSOUP is within the international regs(?).

Just wondering: I've noticed that extras' callsigns are in the format
*#** and **#*, but will the FCC do ***#? (where * is a letter and # is a
number). Or does that style of call belong to another radio service?
I heard that in some areas, the FCC ran out of extra calls.

Some comments on the Heath version of the Pk-232.

1. For FAX, you can hook up a parallel printer directly to the unit.
No computer required. Or you can dump the data out the serial port.

2. These units give command line interfaces a bad name. A couple
of hundred wierd little commands that are hard to remember, don't
interelate well, and are counterintuitive.
  example 1. To change the shift width of the demodulator when
   listening to rtty or TOR you use the WI command. To change
   the shift width when monitoring AX.25 packet radio, you use
   the VHF command.
  example 2. In order to listen to TOR, you need to enter your
   call letters (or some junk) into the storage for the Selective
   Call using the MYS command. Or it won't even listen.
They are really designed to run a transmitter, but their interfaces
make the set/show mode commands in VI look trivial.

Well, it sells driver software.

3. The morse code decoding in the AEA units doesn't track well. A
poster on the rec.ham.radio (Rich Bono?) said he was impressed with
how well his KAM copied morse.

I am considering buying a Butternut HF2V 80/40 meter vertical with the 160 meter add on. I was wondering if anyone on the net has any experience with this antenna. How narrow is the bandwidth on 80 and 160 meters. The add for the antenna says it can be top loaded for additional bandwidth, has anyone tried this, what are the results? Would appreciate any comments.

Operating uninvited on a closed repeater violates the "good amateur practice" clause of Part 97. You might not agree with the decision to close the repeater, but that clearly does not give you the right to use it. In the end, the trustee does reserve the right to choose who does and who does not operate his or her equipment.

>Maybe the FCC rules that make closed repeaters do not GIVE me any right
>to use them, but the license gives me the right to use the frequency, and
>because many people have such licenses, it is reasonable to expect people
>to be using those frequency. The FCC rules DO NOT TAKE AWAY any such
>rights (that may be derived elsewhere).

Having a closed repeater on a frequency does not deny you the right to transmit on the input. It does, however, clearly deny your use of the mechanism which keys the trustee's equipment.

>USING a repeater does not cause interference to that repeater.

Ah, how I long to return to nineland, where repeaters are uncrowded, yahoos are limited, and sideband is actually used! Sadly, in major metro areas, congestion inevitably leads to interference of some form, sometimes unintentional, but very often, deliberate jamming. Would you deny someone the ability to control his or her repeater, so that illegal operation does not occur through it?

>If the OUTPUT frequency is already in use, the repeater should NOT
>transmit on that frequency. It may be in use from any of a variety
>of reasons. The band plans and coordinations, however, point out
>specific accepted frequencies for many types of operations. Some,
>however, are not mentioned in the bandplans, and any frequency is
>fair game.

Depends on who's bandplan you're talking about. Many states deviate substantially from the ARRL bandplan; sometimes to pack more repeaters in, and sometimes to make them feasible (take the ICOM RPT1210 1.2GHz repeater with its 20 MHz split).

>The PROBLEM is that there are many (and this may be MOST of them) closed
>repeaters are just there to serve a clique. They get very little use.

That seemed to be the case out in nineland, but not here. It really depends on the size of the group that runs the closed repeater. Given the ham population density, we tend to see far more people on our closed machines out here.

>I don't want to eliminate the idea of a closed repeater. There is a place
>for closed repeaters. But I think there are too many of them around right
>now in the 70cm band.

Probably due to all of those surplus Mastr IIs and Micors. 2m in Chicago is heavily PL'd, as I recall.

>All "clique repeaters" should move to 23cm.

Odd. Stanford runs an open repeater on that band (1291.5 -20M, 88.5Hz, W6YX/R) so I'm not too sure I agree with you. I did argue the case for keeping it open (not that there was much opposition), given the nature of the club, and of the band. We went "up there" in part to publicize the band, and I don't think that would have worked in the case of a closed repeater.

Personally, I'd like to see open repeaters as the default, but over the years, I've come to sympathize with others who get tired of having their conversation disrupted by some bozo with a nebulous comment. Also, smaller repeater communities mean that I can keep my radio on at my desk; chances are that when someone comes on, I'd actually want to talk to them.

In the end, both open and closed repeater systems have their merits, and the decision to close a repeater depends on the nature of the repeater community; only the trustee is in a position to make that judgement.

Sometimes I think I'll scream if I see this type of comment one more time. There's a big difference in laziness versus a desire not to have to perform makework. And in this case, that's what Morse Code is, makework. What is so special about CW compared to phone, packet, RTTY, FAX, and whatnot that makes it the ONLY mode one must prove ability in to get a license? Sure, as pointed out, it is often the best method for some transmissions, but all modes have their strengths and weaknesses. Tradition? Hardly a valid cause for a legal requirment. International treaty? An unfortunate requirment FOR BANDS BELOW 10M. So why need CW for a 30Mhz + liscense? Hmmm?

As for CW bashing, I really haven't seen any. I have seen a lot of people, like me, asking the above, what makes CW so special? And I, like many others I suspect, am still waiting for an answer. Ham radio is a hobby, and not everyone is interested in all modes. Why jam one specific one down people's throats?

Dave (N2AAM) asks:

> information on this (airfone) system, frequencies, modulation schemes, etc.

=======

Again.....the Monitor America book jumps in to solve this conundrum.
Here is the text from page 562 of the 1985-86 Mon. America....enjoy....

AIRFONE, INC.

On October 15, 1984, Airfone, Inc. began to offer air-to-ground telephone service for commercial airline passengers. Using special cordless telephones which accept standard credit cards, the system offers three-minute calls for a minimum charge of $7.50. A network of ground stations carries the transmissions; computer control 'hands off' calls from one ground station to another as airliners move in and out of range. 32 channels are assigned to each transmission site, following the same pattern in each except for the lowest frequency assigned. All stations transmit on AM signle sideband (A3A).

Transmitter Site	Frequencies Begin
Abajo Peak, UT	945.204
Albuquerque, NM	945.804
Atlanta, GA	945.404
Austin, TX	944.204
Boston, MA	945.204
Bridgeton, MO	944.604
Burlingame, CA	945.204
Charleston, SC	944.604
Charleston, WV	944.204
Chicago, IL	945.804
Delta, UT	944.204
Denver, CO	944.604
Des Moines, IA	944.204
Fort Wayne, IN	945.204
Grand Island, NE	944.404
Hawthorne, NV	945.604
Houston, TX	945.404
Irving, TX	944.804
Jamaica, NY	945.204
Klamath Falls, OR	945.884
Las Vegas, NV	945.404
Los Angeles, CA	944.604
Meridian, MS	945.604
Miami, FL	944.404
Monahans, TX	945.004

Welcome to the crowd. Many old timers are also confused about grounds. The basic idea is that if something is grounded, it has no voltage on it. But wait! A voltmeter always has two leads, and where do you connect the black lead? Through how long a piece of wire?

At DC or 60 Hz, a wavelength is so long, that the dimensions of a ham shack are usually negligible. If your soil is a moist, a short piece of pipe usually works. The typical building code requires an 8-foot copper-plated rod which can purchased at most building suppliers. In older houses with metal water pipes, a connection to the cold water plumbing will also work. You may find a green wire from the back of your washing machine to the water pipes. NEVER NEVER USE THE GAS PIPE!!!

If you get into the details of house wiring, you will find that there are three wires going to every receptical (outlet). One is neutral, and one is the safety ground. These are connected at some point either where the power comes into your house or in the utility company wiring. (The details may be different outside the US.) When a substantial current is being drawn by the lights and other things in your house, a few ohms resistance in the wires times 10's of amperes can cause the neutral to be many volts from the safety ground. The safety wire keeps the metal case of your electic drill or radio from having any of this voltage.

With radio frequencies, ground gets more interesting. As mentioned by a previous poster if the distance approaches 1/4 wavelength, a wire with no resistance might not make a good ground. The question becomes, "what are you tying to achieve by the ground, anyway?" A person working on a circuit inside the radio typically "defines" the chassis as "ground". All voltage measurements are taken with respect to the chassis. Bypass capacitors either connect to the chassis directly, or to a PC board trace which goes to the chassis. If the radio is a handheld or a satellite, this is all that can be done. There is no conductor going to the earth.

The most complex situation is something like a 10 meter station not running QRP and not having a short route to the earth. If the antenna is a just a piece of wire connected to the back of the radio, you might have some unwelcome effects. RF from the antenna can easily flow onto the chassis of the radio, and into the house wiring. The microphone can become a part of the antenna, and give you lips a shock, or get into the audio circuits of the radio. Current following the house wiring can get into TV sets. Radiation from all of these may make your antenna pattern something other than what you might expect from just examining the wire you put up as an antenna. Solutions are numerous, and you might need to do several of the following to solve your difficulties. Then again, you just might be lucky and not need to do anything special.

First, I recommend using some kind of balanced antenna instead of an end-fed wire. Such as a center-fed dipole or a loop. A vertical antenna with radials has its own ground system. If the currents in one part of the antenna can "see" the rest of the antenna, they will not look so hard for some other places to go, like your stereo wiring!

An antenna tuner designed for balanced wires, ferrite beads on the outside of the coax, or a balun will all keep the antenna currents away from the rig. I have heard it said that loop-type antennas act as a built-in balun. I used a quad for many years without feeling any need for a balun.

(As an aside, I do not have a lot of warm feelings for the many popular tuners which have ferrite balun built-in. Almost invariably the balun is on the antenna side of the impedance matching circuit. All baluns work best over a limited range of impedances and frequencies. If a balan is designed for 50 ohms and put where the impedance is something else, the balun may not do a good job over a broad band. My personal preference is either use an antenna with a 50 ohm impedance with a 1:1 balun, or use a tuner designed to handle open wire line. Look in an old edition of the ARRL handbook.)

Someone else mentioned the possibility of a counterpoise (and the MFJ artificial ground). These are really an extension of your antenna system that sets up currents to cancel the RF voltage on the radio. Under some conditions, a LOT of current may flow in the counterpoise, and the far end will be have a very high RF voltage. So watch where you run the wire and how you insulate it. By their nature, couterpoises are narrow banded.

Another consideration of RF grounds is TVI. The initial assumption is that the cabinet of the transmitter is completely sealed. Every transmitter generates some amount of harmonic energy. If there is a small crack in the case, or a key lead is not bypassed, the RF could get outside the radio and travel to a nearby TV set. This is less likely if the outside of the radio is grounded at 50 or 100 MHz! Now we are talking really short connections! If you have a case of TVI with the transmitter connected to a dummy load, you need to either improve the ground, or the bypassing and shielding of the transmitter cabinet. I once had such a situation. Fortunately, my shack is on an outside wall at ground level so a short ground wire was practical. Experiments with shielding and bypassing made it possible to operate with the ground disconnected.

Good luck with your studies, and don't let the other people discourage you from enjoying Morse code.

I am posting this message here for a couple who are hams in Paupua New Guinea. They work as language translators in the bush, and want to use HTs to keep in touch while John is away from the village.

John writes the following:

"As you know, Marsha's dad and mom are leaving for PNG on Nov 29. If its possible, we'd like to get some 2 meter handi-talkies so they could hand carry them here. We're looking for a pair of Icom IC2ATs that use AA batteries/nicads. Something that puts out 5 watts if at all possible since that would help cover greater distances(very few repeaters here).

If AA power is not available any more, we will need a way to charge the battery pack from 115/240 ac (our generator is 50 cycle) or from 13.5v dc (our solar panels - this may require an in-line resistor set up of some sort)."

I thought it might be interesting to post part of his message here. It was written 10/14 and received in Dallas 10/23. Thats not too bad for snail-mail world wide. Lets see how quickly this gets around.

It would be nice to hear from anyone having an idea what the going price is for what they are looking for.

They can spend from $200-$250 dollars for the pair.

This may be be far out, but If a tax deduction is interesting, I think the organiation they work with, qualifies.

Anyone having one or more of these, please e-mail me direct.

Earlier, John mentioned his frustrations with ICOM service.
Bill Everett is ICOM's service manager, and he has a Compuserve
account (meaning E-Mail address). He moderates the ICOM section
of HAMNET on Compu$erve. Bill seems to be a basically good head,
but follows the ICOM party line pretty closely.

Bill Everett K7RIE of ICOM <76702.753@Compuserve.com>

Norm Sternberg of AEA is in the same boat. His INTERNET address
is:

Norm Sternberg W2JUP of AEA <76702.1013@Compuserve.com>

This must be what confused my memory. One of the local 2 meter repeaters has a control link in the 70 cm band because it can't legally be done on 2 meters. I must have mentally added that restriction to all the other bands.

I recognize the scenario that you are using, but my comment still stands. It _might_ be better NOT to cite the fact that you are a ham or any Part 97 provisions in a case like that. Again, this is only an opinion.

> Secondly, I would NOT pose the question for any sort of

Let's not nitpick. You know and I know that the issue is USING the radio to TRANSMIT out of band. That is a reasonable presumption of the intent of a transmit mod.

> I said posessing, not using.

Then you and I are not quite arguing the same point.

> fact, no oob
> operation is covered by 97. Part 97 says what freqs you MAY use, not what
> you are prohibited from using. Anything oob is covered by other regs.

Hams have been fined by FCC for transmitting out of band under the relevant portions of Part 97 covering allowable frequencies. If you are a licensed ham and transmit outside of your allocated bands, you are in violation of the sections of Part 97 specifying your band limits. You may also be found to be in violation of other Parts.

> > Remember that this whole thing got started by somebody who
> > stated he was trying to access non-ham repeaters with ham equipment
> > and wanted advice on how to attain the odd split. Nothing in the
>
> Instead he got told "I don't think you should do what you want. I don't
> know what you want to do for sure, but it surely must be illegal."

Please, please, please read the second line of the above quote again, or better yet the original message if you still have it. The individual in question specifically stated that he was attempting to use a transceiver manufactured for amateur use on non-ham repeaters. That is illegal on its face, unless he is authorized to use those non-ham frequencies by licensure or permission of a licensee in

another service AND the radio will be certified as meeting technical
standards for that service.

 >   Unfortunatley, we have already decided that what he wants is not
 > covered by Part 97, so self-policing doesn't apply. This country

      You have decided that, based on what I _believe_ to be faulty
reasoning. As stated in a previous message to Phil, the FCC can and
does take action against ANY type of license held by a person found
guilty of an infraction of any of their regs. So what's wrong with
advising a fellow ham that he _might_ lose his amateur privileges if
the action he is contemplating is not legal?

>the media.

>I tended to question the media prior to my experience, now I *know* that
>almost anything you see will be heavily biased. Even if it *looks* obvious,
>don't believe it.

I've worked on newspapers on and off since 1959 & I would like to come to their defense, but I can't. I have had stories screwed up beyond belief. There a a few real pros that get it right. But the younger generation for the most part have a bang up journalism education and don't know come here from sic em about the rest of the world. The ones I have met don't care to learn either. I have been in on a couple of national stories and they bore almost no resemblance to the facts. This is in newspapers and they are 10 times better than TV.

Thanks to Robert Casey N6UBM for posting the description of a Two Meter J-Pole.

I have several questions on this antenna that he or someone else might answer.

1. How much power could one push into this when made out of twinlead? Would 5 watts be OK? How about 10?

2. How do you tune it? Trim the top?

3. Can you build this upside down? I.E. Feed it from the top, weight the bottom, and hang it out the window by the coax?

adTHANKSvance,
-edg

--- MONTHLY SOLAR TERRESTRIAL REVIEW ---
September 1990

Report Issued from Data Released by the
Space Environment Services Center
Boulder Colorado

MONTHLY ACTIVITY SUMMARY AND SOLAR CYCLE OUTLOOK OCTOBER 1990 - APRIL 1991

We are now in month 49 of solar cycle 22. Average activity levels and solar indices fell dramatically in September when compared to the August averages. Daily values for the 10 cm solar radio flux, sunspot number, and sunspot area fell by nearly 50% in some cases. In particular, the average 10 cm flux fell by over 45 points to 175.8, the average sunspot number fell 83 points to 186.4, and the average sunspot area was less than half that of August (6,933 million square kilometers [4,333 mil. sq. miles] in August compared to 3,399 mil. sq. kilometers [2,124 mil. sq. miles] in September). This sharp drop in activity averages resulted in a 0.8 drop in the smoothed sunspot numbers for March 1990 from that of February, a similar drop in the smoothed 10.7 cm flux was also noted. The decrease in the smoothed sunspot numbers has turned the prediction model downward again. It is now very unlikely that we will see activity of sufficient magnitude for a sufficient length of time to change the cycle maximum of July 1989. This being the case, solar cycle 22 will go on the record as the shortest rise to maximum ever recorded (only 34 months).

Flare activity was low to moderate during September. Sixteen M-class flares were reported during the month, and of these, only one reached M5 strength. It was an M5/1B from Region 6272 at 21:56 UT on 17 September. In addition, Region 6272 produced two smaller M-class flares earlier on the 17th. The only other Regions that produced more than one M-class flare during the month were Region 6233 and Region 6266. Region 6233 was August's most active region. During September, it produced four M-class flares before crossing the limb. Region 6266 produced only two M-class flares.

Satellite level protons remained at background levels throughout the month.

Geomagnetic activity was mostly unsettled. There were nine days of active conditions at middle latitudes and six at high latitudes. High latitudes also experienced five days of minor storm conditions and one of major storm conditions. This activity is believed to be more in response to coronal hole and disappearing filaments than to solar flare activity. Although the long duration M3/SF on 14 September may have contributed to the geomagnetic activity on 18 September. Likewise the M5/1B major flare of 17 September may have contributed to the activity of 21-22 September.

Early outlooks showed a pulse of activity in September or October with a low around the first of the year followed by a second pulse of activity about April 1991. However, the uniqueness of cycle 22 with its earlier than predicted sunspot maximum and earlier than predicted pulse of activity may indicate that earlier outlooks of future pulses may also be late by several months. The cycle is still expected to contain a relatively flat peak through 1991 (with a slow decline), which would indicate that solar activity throughout the coming year will likely have several bursts of high activity with increasing periods of low activity occurring as the cycle begins to wind down.

Geomagnetic conditions will also contain spikes of activity occurring throughout the coming year due to solar activity and coronal holes, which are showing signs of stabilizing somewhat, in recurrent patterns. The probability of major geomagnetic activity being attributed to strong solar flares is steadily decreasing as the number of flares capable of producing terrestrial impacts also begin to decline. Most of the future magnetic activity will likely be caused by coronal holes and disappearing filaments (as was observed during September).

Radio propagation conditions over the coming year will, likewise, experience brief periods of poor to very poor conditions due to the magnetic and periodic solar activity. Overall, however, radio propagation conditions are expected to remain very good over most paths as sunspot numbers continue to remain elevated over the next year or so.

* = Preliminary estimates

The lowest smoothed sunspot number for Cycle 21, RI = 12.3, occurred in September 1986. The preliminary sunspot maximum for this cycle (cycle 22) remains July 1989, with a peak smoothed sunspot number of 158.1.

SUMMARY OF GEOMAGNETIC ACTIVITY FOR SEPTEMBER 1990.

Global geomagnetic activity peaked on 12 September with an estimated planetary A-Index value of 24. On that day, the eight estimated planetary K-indices were (starting at 00 UT): 5, 4, 3, 4, 3, 3, 3, 3. High latitudes experienced the most severe geomagnetic activity, reaching major storm conditions on 11 September. The magnetic observatory at Anchorage Alaska recorded an A-Index of 50 on 11 September. The eight K-index values for Anchorage were (starting at 00 UT): 3, 3, 5, 7, 6, 5, 4, 4. Middle latitudes closely followed the planetary figures throughout this period, implying that the strong geomagnetic activity remained confined to the high northern latitudes.

Global geomagnetic activity reached it's lowest value of the month on 30

September, with an estimated planetary A-Index of 6. Estimated planetary K-Index figures for this date were: 2, 0, 1, 1, 2, 3, 2, 2. Middle latitudes had K-Index figures slightly below these values, while high latitudes had figures slightly above these planetary estimates.

NOTES:

- Xray Flare Classes (weak to strong): C, M, X (with sub-categories rated from 0.0 to 9.9 in each class).

- Optical Flare Classes (weak to strong): S, 1, 2, 3, 4 (with an attached figure identifying brightness: F-Faint, N-Normal, B-Brilliant).

- Locations are given in latitude and longitude as measured from the central solar meridian.

- Sweep Frequency Intensity represents the intensity of detected solar radio frequency bursts (bursts sweep over large frequencies). Type II and IV almost always represent ejection of solar material through the solar corona and into interplanetary space. Intensities are rated from 1 to 3+.

In my original query about doing non-25 Khz splits for the IC24, I was very clear about why I was interested--there are a number of open 2m ham repeaters in the L.A. area (which is extremely congested with repeaters, but not that many open ones) which have non-standard splits that are not multiples of 25 Khz. That's my interest.
I don't appreciate Faunt's insinuation to the contrary.

Perhaps he was confused by other people who followed up the original thread with other desires regarding odd splits for out-of-band operations. Such operations are of zero interest to me since I don't operate out of band (hell, I haven't even done the well-publicized modifications to my IC24 to transmit in the legal part of the ham bands which it doesn't cover as shipped...)

By the way, nobody came up with a simple way of doing non-standard splits on the IC24.

The 468/f formula results in the antenna being 5% longer than in free space because of capacitive "end effects." Insulation has the effect of increasing the capacitive reactance of the wire some more (via the dielectric effect.)

But in my experience the 468/f(MHz) formula has always been about 3% long, and I doubt that the added capacitance of the insulation will make a very large difference.

So, go ahead and use the 468/f method. You will probably just trim less wire to make it resonate.

If you are using expensive wire, then add another 2-5 percent to the length, just to be safe.

You are only responsible for identifying YOUR transmissions, the repeater is responsible for identifying it's transmissions. YOU are only radiating a signal on the repeater's input. This is the only signal you are responsible for IDing. Whether the repeater retransmits your signal is immaterial.

One of the local repeater frequency coordinating committees published some interesting statistics on the number of repeaters in Southern California the other day. Assuming I copied the numbers correctly from the bulletin that was read on the air, there are 1,736 VHF & UHF repeaters and remote bases coordinated in So Cal (and quite a few more uncoordinated ones).

These break down as follows:

13	open	6m
9	closed	6m
180	open	2m
108	closed	2m
115	open	220 MHz
172	closed	220 MHz
31	open	450 MHz
488	closed	450 MHz
7	open	900 MHz
23	closed	900 MHz
21	open	1.2 GHz
65	closed	1.2 GHz
504	multiband remote base	

(Note that 'closed' and 'private' are rolled together: the former merely requires club membership which is open to any applicant; the latter is by-invitation only. They didn't mention any statistics on how many there are in each of these categories.)

> The reason I never came back is that I was very clear in my original message. There are a number of 2m ham repeaters in L.A. with odd splits, and I'd like to use them if possible. I don't appreciate your public insinuation that there was something bogus about wanting an odd split. Take a look at the repeater guide for L.A. and you'll see that a number of the best located open repeaters use odd splits.
>
> You may be confusing my message with some followup messages that were from people who had clearly illegal uses in mind. In fact, I sent one of those people mail telling them that what they had in mind was illegal. (They basically replied that they didn't care.)
>

Sorry, I didn't mean to insinuate ANYTHING. That was aimed at the people who were flaming you without considering that you might have a legitimate use for the information. My point was supposed to be that there was a great deal of heat about your request, and almost no light.

I believe you mentioned a 6.46 split on VHF which can't be done inside 2 meters. Yes, there are funny splits around, and weird splits have many legitimate uses, including the one that I use that capability for on my IC-32, that is, have the local police/fire/whatever frequency in memory for monitoring, but have the split set so that on key up the unit transmits on a legal but unused frequency.

My public apologies for writing something that you misunderstood.

No, the person asking about the 6.46 split was one of those other people--I believe the person in question wanted to access a telco paging repeater with a ham HT, and it was his message that started off the "type acceptance" thread.

I never mentioned a particular split in my message, just that the oddball 2m ham repeaters in L.A. that use odd splits don't fall on multiples of 25Khz.

The repeater congestion problem is so severe around here that there is serious talk of going to a 15khz channel allocation for the ham bands.

>from its base would extend beyond the property line of the owner."

How about this one: "No tree shall be allowed to grow that if it fell
from its trunk would extend beyond the property line of the owner."

After all, fair is fair!   :-)

Insulation will have a definite but neglible effect. The dielectric
constant of insulation differs from that of air, so it will have a small
impedance changing effect. It is probably less than the experimental
error in cutting the wire, or effects from how the wire is supported.

But, that is why you should always prune the antenna for best operation.

This is my signature. It doesn't contain my name at all!

]   Hams have been fined by FCC for transmitting out of band under
]the relevant portions of Part 97 covering allowable frequencies. If
]you are a licensed ham and transmit outside of your allocated bands,
]you are in violation of the sections of Part 97 specifying your band
]limits. You may also be found to be in violation of other Parts.

...

]The individual in question specifically stated that he was attempting to
]use a transceiver manufactured for amateur use on non-ham repeaters.
]That is illegal on its face, unless he is authorized to use those
]non-ham frequencies by licensure or permission of a licensee in
]another service AND the radio will be certified as meeting technical
]standards for that service.

I should point out that some military services do NOT require technical
certification. I use amateur equipment on CAP frequencies and National
Guard frequencies - both with authorization. There is a CAP license, but
no license required for national guard. Neither have technical standards.
Also, the air force around here uses Kenwood ham HT's for their base
commander's net.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

They have. In Monitoring Times, there was some mention of a florida law regulating scanners that exempted TV stations (but not newspapers).

In article <1990Oct20.194300.23704@wpi.WPI.EDU> gkd@wpi.WPI.EDU (Gregory K Doerschler) writes:
>How about this one: "No tree shall be allowed to grow that if it fell
>from its trunk would extend beyond the property line of the owner."

Greg has a very good point here, although he didn't come right out and say it. Trees very rarely fall from the base of the trunk, and likewise, towers very rarely fall from the base. A more reasonable law would limit the height to 2 or 3 times the minimum distance to the property line. The next time you drive around in an area that has had a hurricane, tornado, or just a strong windstorm, notice the damaged towers. Usually they fail near the middle; they don't come anywhere near the property line.

SB RTTYDX @ RTTYDX $RTDX1019
RTTY DX Notes 1of3 10/19/90

RTTY DX Notes for week ending 19th October 1990
BID: $RTDX1019
Part 1 of 3.

Good ideas never die. OZ3TQ has revised the idea of half speed ARQ blocks for long haul communications. It worked this past week with a contact with VK2SG. The link was held for some time despite some QRM. It is worth thinking about, but it is not sure if the PK232 or like units will work in this manner, but they are under investigation. It is a matter of computer software. More information as further development takes place.

Our thanks this week go to I5FLN and cluster, JA1BLV, JH1QDB, OD5NG, TG9VT, VE3XJ, VK2EG, W2JGR, and the Tri-State DX Packet Cluster Network. Thank you all for you information.

RTTY DX Notes 3of3 10/19/90

RTTY DX Notes for week ending 19th October 1990
BID: $RTDX1021
Part 3 of 3.

QSL Information:

UW0LZ requests his cards via Box 75, Vladivostok 690090 USSR.

8Q7DA will QSL via DL3RBF.

UI9ABV collects from Box 40/1, Tashkent, Uzbek, 700040 USSR.

5N3ETP QSL manager is N6QLQ.

ZL0AIC says to QSL via HB9AAA.

FW1FM looks at Box 20, Futuna Island for his cards.

PJ8JP allows AB1U to handle his cards.

Notes Of Interest:

Unfortunately, 8Q7DA has been and gone. He was there for only one week, October 10th to 17th.

Barbados. K4FJ and K3ZR will operate from October 20th through November 1st, signing 8P9KR and 8P9HQ respectively. QSL 8P9KR to K4BAI and 8P9HQ to K3ZR.

St Pauls Island. FP5DX and VE1KM will operate CY9SPI and CY9DX from October 20th with RTTY on 14 and 21 MHz. QSL to FP5DX.

JH1QDB, Kuni, reports that he had 929 QSOs as JD1 on his recent trip. The cards are being printed and should appear in November.

Malpelo Island. HK0TU is on schedule for November 3rd. RTTY frequencies are 1825, 3635, 7035, 14085, 21085, and 28085 KHz. QSL to HK3DDD.

Juan Fernandez. CE0ZZZ is also on schedule for mid November, according to F2JD.

ZK3KY will go QRT around October 25th. Then the chore of QSL cards will start.

GL DE DX1

Written by VK2SG. Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA.
Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU.

Regarding the tower height being limited to what would not cross over a property boundry:

What is the difference between towers and trees? (Other than that trees fall much more often.)

Homeowners seem to deal with that issue without problems. Give me a 500' tower anyday over a 100' pine tree. I have never seen a tower crush a building. I have seen lots of trees.

regards,

Alan Barrow km4ba

Here is a question that several hams were discussing over lunch:

One ham, (a contractor) indicated that you can read all your closing documents, and still not be aware of possible covanents. He said that most covanents were recorded on the plat for the subdivision, and do not always show up on the deed.

He further indicated that you do not actually see a real "deed". What you see is a warantee deed to secure debt, or something like that.

This concerned me, because if it is true, you can be legally bound by language that you have not had a chance to inspect.

My contractor friend feels the only way to be sure is to go to the tax office where the plats are kept, and visibly inspect the plat.

BTW, the house I bought is 25 yrs old, and I felt I had no covanents affecting me. I do know the original subdivision had some.

My friend thinks I may be bound by these. I felt I wouldn't, since I did not sign anything that discussed them.

Anyone have any info on this? I suspect it may vary from state to state.

I know there are several home that violate the orig covanents in various ways, so I don't think anyone is enforcing them anyway.

But I would be interested in any one with information on how they restrictions are handled.

73,

Alan Barrow km4ba

>bands.

I know you've been off the air for a while, Lauren, but Southern
California went to 15khz channels in the upper two megs of 2 meters
around 1975.

They're already assigning 12.5 khz channels on 450, and 25 khz channels
on 1296.

He's right you know. CW is better than voice for working DX. The information content of a DX contact is so small that the low information rate of CW is not a problem and CW is usable at a lower S/N ratio than voice with simple equipment. My opinion is that CW is not, in general, the best way to convey information per unit time, but it is certainly useful in some situations. This doesn't mean that I think EVERYBODY needs to demonstrate the ability to work CW to get a ham license. I definitely support those who WANT to use CW to do so. I would certainly enjoy HF more if all DXers switched to CW operation. :-)

It's been my experience that insulation shortens the antenna some. It probably depends on the dielectric constant of the insulation. I don't have any pat formula.

Hey! Anyone else remember this? I remember all the OFs jamming this one.

I decided to check my QST collection from 1970.

This is from the July 1970 editorial, "It Seems to Us".

"A few young activists among us, banging the drum for complete freedom of speech, have labeled our view reactionary, out-of-touch with reality. We disagree, and suggest that more accurately it is these idealists who are the ones out of touch with reality, perhaps being too young to have learned that Utopia and practicality are not always compatible."

From the corresponce section in the November 1970 QST:

"Our rebels are gumming up the airwaves with left-wing revolutionary garbage, and the extremists of the right are fighting back with name-calling, jamming, and all the techniques they accuse the other side of using."   -W8GOE

(Gee.....sounds like 20 meters 20 years later. Could it be that the "good old days" are a result of selective memory?)

Correspondence, September 1970 QST:

"I resent your slur on the name of the former Senator Joseph McCarthy. Senator McCarthy was a great American who sought to call attention to some dangers besetting the United States. He was meticulous and accurate in all of his assertions. After he was hounded to his death by the anti-anti-communist wing he was proven correct in every case, usually by admission of the persons involved." -WN6KCO

(He was pissed because the July editorial accused jammers of the student net of "Joe McCarthy tactics.")

"I'm ashamed to call you HQ men brother hams! You advise us not to discuss politics on our bands. Why? Gentlemen, we have a piece of paper called the First Ammendment." -W2OQK

Just a little trip down memory lane....

looking for early transistor radios again--1954-1964.

especially early transistorized AM/SW, and AM/FM/SW sets such as the Admiral 909 All-World, RCA 1MBT6 StratoWorld Mk 2, etc.

Looking for parts for 1960 Philco T9 Trans-World. WIll take a junker.

Yup, I really went and did it that time! I forgot to gently remind folks to be sure to select all the different options. Like: TAR, CPIO, or "PURE DATA"; compress or no compress; media, density, and blocksize (as appropriate); insurance or not; PLEASE give me a return email address; and also PLEASE include a self-addressed sticky label so there is no question where to send the stuff back to.

Thanks!

I am a no-coder, and what many people seem to have trouble grasping is that we don't wish to ban or negate Morris. It is also not the reason I became a ham. I do know one no-coder who became a ham and an extra at that because he really liked HF contesting. Yes, I even have friends who think an evening at 35 WPM is fun and relaxing. They, like me, think that testing CW is not germane to the intent and purpose of amateur radio in the latter part of the 20th Century. Forty years ago, Morris was a marketable skill. Today, soldering and typing are marketable skills. If the purpose of amateur radio is to be training and self education, then the exam should reflect current technology.

I have friends that are sports spectators, some that do crossword puzzles, and by god some that are virtuosos at the key. They do these things to relax. I didn't become a ham because of Morris, in fact if there had not been no-code licencing in Europe, I may never have become a ham. When I came to the U.S., I struggled through CW to sorta painfully do 5 WPM only because I was tired of renewing my reciprocal licence and decided life would be easier with a U.S. call. Besides the problems with all the people who did not know what "G8LUK" was and thought I was a pirate or maybe an Australian station.

Yes, I did potter about on CW and worked some DX in the Novice bands. I didn't enjoy it. I don't enjoy crossword puzzles either. But you want to do CW? Be my guest. You think everyone who wants to be a radio

amateur should pass a CW proficiency test so they can do RTTY with a
C-64? Get real.

Its not an apartment complex or homeowners assoc, but the mobile home park
I lived in in Tempe (Tempe Cascades Mobile home Park, on University Drive)
did not allow transmitters ofany kind to be used on the park grounds.

Or, at least, that is what the rules said. They did not enforce them,
considering there were at least 3 ham antennas up and in use (only
one of which was mine :-).

-- MAJOR SOLAR FLARE ALERT --

OCTOBER 20, 1990

Potential Impact Forecast
Flare Event Summary

MAJOR ENERGETIC EVENT SUMMARY

A major solar flare occurred at 18:06 UT on 20 October. The flare was rated a class M8.5/1N event (quite powerful) and was produced from Region 6311 at location N15W82 (latitude, longitude from the central solar meridian). The flare officially began at 17:53 UT and ended at 18:12 UT (relatively short). The event was accompanied by strong radio bursts at high frequencies, but very weak bursts at low frequencies. A fairly weak shortwave fade was observed during this event. Post flare loops became visible at 18:41 UT and continued in progress for a couple of hours after the event.

No further major flares are anticipated from Region 6311 before it passes beyond the western limb in 24 hours. However, there is a risk that this region will produce a low to moderate level M-class flare before it's passage beyond the western limb. Probabilities for flare activity over the next 72 hours (from 21 October to 23 October) are:

Class M Flare: 45%
Class X Flare: 05%
Proton Flare: 05%

POTENTIAL TERRESTRIAL IMPACT FORECAST

The major flare is not expected to produce a terrestrial impact with the Earth. Although the flare was certainly powerful enough to cause a strong impact, it's position on the solar disk (far on the western limb) is too far to cause any significant impacts.

However, although this major flare is not expected to have an impact with the Earth, another solar event very well could have a moderate impact with the earth. A large 30-degree long solar filament located between N48E01 and N32W23 disappeared sometime between 15:13 UT on 19 October and 00:58 UT on 20 October. This event is expected to produce an increase in both geomagnetic and auroral activity within the next 48 hours. Radio propagation conditions will likely also become somewhat degraded at that time. For more information regarding this event, see the Solar Terrestrial Forecast and Review for 20 October.

The first time I bought a house and discovered this, it was mind boggling... someone 20 or more years ago decided on certain uses for the property, and that remains in effect FOREVER, even though they don't own it anymore...

incredible.....

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---
October 20 to October 30, 1990

Report Based In-Part from Data Obtained from the
Space Environment Services Center
Boulder Colorado

SOLAR TERRESTRIAL REVIEW AND SHORT-TERM FORECAST

By far, the most interesting day of the week occurred on 20 October when Region 6311 (N15W90) produced a major class M8.5/1N flare at 18:06 UT. This event was relatively short lived, lasting only 19 minutes, but produced some strong high-frequency radio bursts along with a relatively weak short-wave fade. Post flare loops became visible at 18:41 UT on 20 October and continued in progress for several hours after the event. This same region was also responsible for producing a class C8/SF flare at 05:10 UT on 20 October.

A large 30-degree-long solar filament also disappeared on 19/20 October. This filament was located between N48E01 and N32W23. It vanished from this location sometime between 15:13 UT on 19 October and 00:58 UT on 20 October. This event could have a potential impact with the Earth within 48 hours.

Geomagnetic activity varied from quiet levels to minor storm levels. The most active day of the week was 15 October, when middle latitudes experienced unsettled to active conditions with several brief bursts of minor storming. High latitudes remained mostly active with periods of minor storming. Activity then became quiet until 20 October, when another brief period of minor storming occurred at both middle and high latitudes.

Auroral activity was not visible during most of the period at low and middle latitude locations. High latitudes, however, witnessed periods of low to moderate auroral activity, particularly on 15 and 20 October.

Radio propagation conditions were, for the most part, good to very good throughout the week. The only exception was 15 October when high and northerly middle latitudes experienced degraded conditions due to geomagnetic and auroral activity. Low latitudes have maintained mostly good to very good conditions throughout the week.

Solar activity is expected to quickly become low as Region 6311 rotates beyond the western limb within the next day. Before this occurs, however, there is a slight risk of a low to moderate level M-class flare from this region. Accompanied with this risk is the potential for related short-wave fades. However, any short-wave fades occurring over the next 24 hours (until approximately 22 October) will be of low-intensity and relatively short duration. No further major flares are anticipated from Region 6311 before it rotates beyond the western solar limb.

Geomagnetic activity is expected to become unsettled to active with a risk of storm conditions (particularly at high and northerly middle latitudes) between 21 October and 23 October due to the recent large disappearing solar filament. No effects from the major flare are anticipated due to its location on the solar disk. The solar filament which disappeared was located relatively far north and may not produce significant geomagnetic activity. However, the risk for potential storm conditions cannot be entirely dismissed. Determining the potential impact of such events can be quite difficult and elusive. Current models suggest that the filament impact will probably be only modest.

Auroral activity is also expected to increase in tandom with geomagnetic activity. High latitudes could experience moderate to possibly periods of high sporatic auroral activity. Present models indicate that high-latitude activity will likely only reach moderate levels. Middle latitudes will witness mostly low to sporatic moderate auroral activity. Low latitudes will be unable to spot any auroral activity.

Radio propagation conditions may become degraded as effects from the disappearing filament engulf the Earth. Propagation at high latitudes is expected to become poor to very poor until approximately 24 October when conditions should again return to near-normal (fair to poor). Middle latitude paths may suffer fair propagation conditions on 21 - 23 October. There is a risk that middle latitude propagation will become fair to poor until 23 October, depending on the severity of the impact from the disappearing filament. Current models, however, suggest that propagation will be confined to fair conditions over middle latitude paths. Low latitudes will likely maintain good to very good propagation conditions throughout the next week. No significant impact is expected with low latitudes, although some slight decrease in propagation quality may be noticable until 22 or 23 October when conditions should return to normal or above normal.

SIDE NOTE: Potentially good to very good Meteor Scatter propagation should be possible in the evening and early morning hours of 21 and 22 October. The Orionid meteor shower peaks on these days and usually produces approximately 20 to 25 meteors per hour. Meteors should increase in frequency after the midnight hours.

```

NOTES:

This graph ONLY depicts geomagnetic conditions observed at Boulder, Colorado for the past 87 hours. Conditions to the north of Boulder will generally have slightly higher activity than Boulder, while conditions to the south of Boulder will likely have lower activity than those depicted here. However, the plots should present a good approximate average of planetary geomagnetic conditions.

"Anomaly Intensity" is meant to represent nothing more than a very rough guide to the --potential-- interaction geomagnetic fluctuations --might-- have on earth-based systems sensitive to magnetic fluctuations (ie. electrical power distribution networks, telecommunications networks, etc.).

For radio signal propagation purposes, plot lines are approximately proportional to propagation quality when plot lines are below Minor Storm conditions. Propagation quality may deteriorate rapidly (ie. non-proportionally) when plot lines reach or exceed Minor Storm levels. Complete radio blackout conditions on all short-wave frequencies may occur if plot lines reach or exceed Severe Storm levels.

PLANETARY 10-DAY GEOMAGNETIC ACTIVITY OUTLOOK (21 OCTOBER - 30 OCTOBER)

```

   |    Conditions     |       Given in 8-hour intervals       | Intensity  |
   |________________________________________________________________________|
```

NOTES:

Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

GRAPHICAL ANALYSIS OF SOLAR ACTIVITY OVER THE PAST 60 DAYS

               Cumulative 60 day Solar Activity Record
                   Start Date:  August 22, 1990
```

NOTES:

Left-hand column digits represent the 10.7 cm solar radio flux obtained from Ottawa. The right-hand column describes the relative solar activity for that period based on the average number of major and minor flares that can be expected for related solar flux values. Plot lines labeled with the letter "F" represent days where at least one major flare occurred (ie. class M5 or greater flare).

  --------------------------------------------------------
```

NOTES:

Latitudinal boundaries are the same as those given above for radio propagation quality. Periods of high auroral activity may be suitable for auroral-propagation. Locally visible moderate auroral activity will almost always cause moderate to strong deterioration in HF signals, while locally visible high auroral activity will render most HF bands useless.

Auroral activity is defined as follows:

NOT VISIBLE: Not visible

LOW: Diffuse, inactive auroral activity visible very near the northern horizon for mid and low latitudes.

MODERATE: Visibly active, but not exceptionally bright auroral activity most visible above the northern horizon for mid to high latitudes. This type of activity usually encompasses torch-like (or beam-like) aurorae mixed with low-intensity curtain aurorae.

HIGH: Visibly very active, with periods of bright, pulsating curtain aurorae possibly mixed with moderate intensity zenith aurorae. Can occur to the north as well as stretching up near the zenith, particularly at middle latitudes. There may be some color fluctuations discernable.

VERY HIGH: Very active, very bright and very colorful auroral activity possibly mixed with intense zenith and curtain aurorae. Visibly strong pulsations with auroral boundaries to the zenith, stretching even partway to the southern hemisphere of the sky.

EXTREMELY HIGH: Rare, incredibly bright auroral activity with rapid color and brightness fluctuations mixed with very strong rapid auroral pulsations visible throughout the entire sky.

There are three plotted lines per day in the auroral activity prediction charts. Each of these three plotted lines represent three periods during the evening/morning when auroral activity can be seen. The first line represents the evening twilight period. The middle line represents the --local-- midnight sector, while the last line of each day represents the morning twilight period.

The auroral activity predictions charts are heavily based on recurrent phenomena and may not be accurate in the longer-term due to unforseen and unpredictable transient events (ie. such as solar flares).

The visibility of auroral activity depends on your location and the brightness of the sky (which is dependent upon both city lights and lunar phase). These charts do not account for these variations. The charts are based on dark-sky conditions (lunar phase excluded). Aurorae occur independent of sky brightness, so just because auroral activity may not be directly visible (due to lunar phase, for example) does not mean auroral activity isn't in progress.

If is against the law to listen to cordless telephone transmissions, I guess I better stop turning my cordless phone into a speakerphone by listening to my signal on my scanner!

Here are a couple of historical references that may be of use to the current discussion on the responsibility factor of CBS network. (This may be similar to throwing gasoline on a fire.)

In 1969, CBS aired a program called HUNGER IN AMERICA. The program opened with a dramatic rescue attempt in a San Antonio hospital of a small baby. The program stated that this child, like many others in America died because of hunger. WRONG! The child's parents were well-to-do and the child was very premature. Hunger or malnutrition was not a factor in this death.

In 1971, CBS aired the program THE SELLING OF THE PENTAGON. The pentagon charged that CBS took the answers to one question and re-arranged them to form the answer to another question. This process made the pentagon appear in the worst possible light. On investigation, it was discovered that the pentagon secretly videotaped the interviews, also. The "secret" video tapes proved that CBS had altered the responses in order to make the program more sensational.

Remember the 1968 Democratic Convention in Chicago? There is lots of evidence that CBS news crews were staging confrontations between police and protestors.

Remember Dan Rather's faked trip into Afghanistan?

CBS has a long history of distorting the news. If you want to call CBS irresponsible, you will have to stand in a long line to do so.

I am in the market to buy a new scanner ... I would like to have coverage of
all bands, 30 mhz to 950 mhz. I would appreciate email from anyone that would
be willing to give me their opinions on the various models out there.

David

]tax office where the plats are kept, and visibly inspect the plat.
]
You can do the following: specify in your written offer that it is
contingent on your approval of the CC&R's. Further specify that
the seller must deliver them to you by specified date for your
approval. I've done this - it works.

The question you ask is backwards. WHY do people want to broadcast their private lives to everyone withing two miles? What makes people think that what they broadcast is stopping at the edge of their property?

Your question is a lot like asking "WHY do people want to keep and bear arms?" Not everybody does. But, the Constitution says it is our right to do so if we wish. I very much like the description of the airwaves from "The Capitalist Manifesto", which says the airwaves are a limited resource that belong to everyone. This is the basis for TV/Radio licenses, which are (supposed) to be granted to the station "as a public trustee". They were not given the air, they were 'loaned' it, to use in our interest. Those frequencies being used by my neighbor are not his personal airwaves. They are mine, too.

You might claim users of baby monitors do no know what they are doing. True. But, it is not illegal for me to buy a piece of apparently worthless property from someone who doesn't recognize gold bearing quartz when I do. He lost because he didn't know what he was doing. I gained because I did. "Baby monitor" gave up personal information because he doesn't know what he is doing. I gain because I do.

This is my signature. It doesn't contain my name at all!

Just wanted to comment on a few things:

1) Just worked the JOTA (Jamboree on the Air) for a local Boy Scout Group. Had a lot of fun, made about 12 QSO's in 3 hours (which is good, considering that usually I made a contact, and then handed the mic around the room) and even hit K2BSA/1. Was searching for DB0BS(something), the German station, but missed it. Oh well... The kids had fun, and I think with a little work, three of them might be Novices soon (which is one reason I like doing the JOTAs). I remember meeting a ham on Field Day in 1978, when I was still a Scout myself. He had set up at a local camporee, and was having the time of his life. That got me started in this crazy hobby, and it's fun to pay back a bit. Anyone else work the Jamboree? What did you think? I found that with so many high-pitched voices, I had trouble zero-beating..... I kept thinking that I was off, since the voice was so high...

2) I have an Alinco DJ-160 HT. I've never had problems with intermod, but the manufacturer lies about wattage output. I have both the EB-10 (rated .2/2.5 watts lo/hi) and the EB-12 (rated .5/5 watts lo/hi) and have found the real output to be about right at the low level, but about a watt less in both cases at the high level. Not too badly off, but still less than I was expecting. I'm still looking for the MARS-CAP mods for this radio, though.... anyone have them (forlorn hope)?

3) What defines "Type-accepted"? Our local Civil Defence group has considered using ham radios because in our experience, they are better radios. We hooked up a Kenwood 231 and a Motorola both txing in the public service bands, and compared them. The Kenwood was easier to use, suffered less intermod (a problem here, since our antenna is 20 feet from the County Police antenna), and according to the spectrum analyser, had a "cleaner" signal! (-43dB reduction

for the Kenwood, vs -21 for the Motorola). Also, they're cheaper, in general.
If we could get a crystal controlled Kenwood, we would buy it in a second!. As
it is, we just look at them and sigh.

Well, I've taken up enough bandwidth for today.

> Let's not nitpick. You know and I know that the issue is USING the radio to TRANSMIT out of band. That is a reasonable presumption of the intent of a transmit mod.

I modified my radio to transmit out of band, with the intent of (but NOT on a regular basis) to be able to transmit out of band. That is a simple enough conclusion. But the intent was not to do anything illegal, since there exist more than one legal case of transmitting out of band (IMHO).

I just want to make sure someone doesn't suggest that the POSSESION of radio so modified be made illegal just because they have not considered the LEGAL reasons for transmitting out of band. clearly if there comes to be a law making it illegal to posses equipment capable of transmitting on any frequency you don't have a license for (aside from part 15 devices and such) there could be many problems with, such as making illegal those devices intended for other than over-the-air transmission, like the drivers for transverters. You COULD do something illegal with it, and you COULD do something legal with it.

> Hams have been fined by FCC for transmitting out of band under the relevant portions of Part 97 covering allowable frequencies. If you are a licensed ham and transmit outside of your allocated bands, you are in violation of the sections of Part 97 specifying your band limits. You may also be found to be in violation of other Parts.

And I believe that, in the intended circumstances, that 97.403 can in fact make out of band transmission "legal". But if there is any doubt about the proper application of 97.403 in any circumstance, you can bet that a court will be making the actual determination. The FCC could very well take someone to court and argue that the circumstance were not what 97.403 was meant to cover. I am not certain just what they were intended to cover, but I have some ideas.

> another service AND the radio will be certified as meeting technical
> standards for that service.

But there exist certain "legal" uses.  I suggest people not be so quick
to say things like "what you plan to do is illegal" but rather examine
it closely and if you must say something, say things like "I'm not sure
what you intend to do, but I'd like you to be aware that this mod readily
allows you to do many illegal things.  I hope your intended use is legal".

> the action he is contemplating is not legal?

There's nothing wrong with it.  I just don't believe it falls under the
concept of hams self-policing their own service.  A case in point could
be Captain Midnight's adventures with HBO's satellite feed.  I doubt if
he would have listened, as I am sure he knew it was blatantly illegal.
Still, it would be OK to have advised him not to do it (had you known him
and known he intended to), but it would not really have been a part of
ham self-policing.  It's just the same as telling anyone not to do anything
that is illegal.

> As a practical matter, the enforcement of CCRs is usually turned over to a homeowner's association. Unless they have an extremely vigorous enforcement gestapo, contract abandonment is very likely. The only other people that could report you to the gestapo (the neighbors) probably don't even remember all the fine print on the CCR document and the other flurry of documents they signed when their house closed.

If your neighbor just does not like your tower or antenna, for whatever reason, and talks to his lawyer, then the game suddenly changes because the lawyer will think of checking on the CCRs. That's his job.

> > The problem is that both of these routes are expensive, risky and can lead to neighbor problems (which is bad new for everyone). We had a ham here in AZ who spent $22,000 fighting deed restrictions that had prohibitted him from putting up a dipole, and he lost the case.
>
> The other practical aspect of homeowner's assn enforcement is that most of them are flat-broke. The legal strategy is to get your lawyer to file expensive and time-consuming motions until their money runs out.

It's going to cost YOU a lot of money to have your lawyer do all these things (in the usual cases). The association might well be paid a lot of the money by the complaining neighbor(s). And they would stand a lot better chance of recovering their legal fees should they prevail than you would if you prevail. Your lawyer can give you the proper details if you encounter this situation.

> > I am not a lawyer. These are just my opinions. Your mileage may vary.
>
> I'm not a lawyer, either. These are just some personal observations from another ham stuck under a CCR.

Most of us aren't, unfortunately (or maybe that should be fortunately).

> I wonder now if, because the antenna clause was abandoned on my CCR on enforcing the HF6VX on the ground, I can now put up a "real" antenna on top of the roof. (heh, heh, heh.)

Speak to your lawyer. Talk with him about:

- Recording some evidence about the existance of your present antenna and the time period it has been up.

- Checking with what laws might be applicable whereby you could have the actual CCRs removed by court order on the basis of abandonment of the CCRs before putting up the bigger antenna.

-=-

Im looking for information on the above units besides the few lines mentioned in the various SW/Ham catalogs. Things like grey/scale or B&W fax, ect....

Perhaps the most important thing im looking for is software to run any (or all) of these on an Amiga. If im reading the few lines correct, all can use a simple terminal program for the various modes except Fax. So does anyone use any of these with an Amiga or know of software to use them with an Amiga that will receive -all- modes?

On the same note, do any of them supply information so that I could write my own?

> My friend thinks I may be bound by these. I felt I wouldn't, since
> I did not sign anything that discussed them.

There may be language in what you did sign that binds you to them and it may not even be obvious.

When you are contemplating a house purchase, discuss with your lawyer just want you want. You might add clauses (have your lawyer write them) making the deal void should certain things turn up. Real Estate lawyers should know all the places to look for where the covenants can be registered. It would ultimately be your responsibility to look them up.

> Anyone have any info on this? I suspect it may vary from state to
> state.

It definitely does vary from state to state. As for general info, you could read through the books and study guides on real estate sold in the academic bookstores serving the nearest college/university law school. I have found the Nutshell book on real estate law rather interesting. It covers a lot of the conceptual things that would generally differ fron state to state, but only in detail (such as number of years for abandonment of a covenant).

> I know there are several home that violate the orig covanents in
> various ways, so I don't think anyone is enforcing them anyway.

That can be evidence of lack of enforcement; meaning you might get away with it. It is not going to generally be of any use in your defense unless it is the exact same covenant, and then your lawyer is going to have to be good at his job to connect the applicabilities.

> not?

Jim, you are asking questions about MORALS. There may be as many different answers as there people asked.

It's OK to ask questions about MORALS, but I don't have to answer if I don't want to. It's OK to ask what I do in bed, but I don't have to answer if I don't want to. I don't want to answer either question.

I hope your question on morals has ABSOLUTELY NO CONNECTION whatsoever to the LEGAL issues. I for one don't want to see ANY law based on morals. The main reason for this is that there are SO MANY DIFFERENT systems of morality to choose from.

I can imagine many reasons why people might listen in on radio transmissions. I can imagine many reasons why people might open the envelope containing the pictures of you and your significant other in bed together.

Yes, Jim, I *AM* EVADING your question. The reason is because no matter what the answer is, or who answers it, it is NOT RELEVANT.

I am only interesting in making/keeping such listening LEGAL so that the MORAL issues don't have to come into play as arguments, so that we don't have to deal with the conflicts that would arise out of the differences in moral beliefs we all have.

Isn't it strange that so MANY issues all come down to someone questioning someone ELSE's moral beliefs? Can't we all just live together despite our individual differences without having to question, judge, push, pull or promote any of them?

Suppose I need to QRO to 800 watts in a quad yagi array to hit a repeater many many miles away. What if I then QRP to 10 milliwatts to ID? The FCC might well be listening to my 800 watt signal and not be picking up the 10 milliwatt one. Have I LEGALLY ID'd?

I don't know.

I personally consider it important that my ID have basically the same coverage as my just recent transmission.

However there do come to be circumstances where one just cannot ID because they cannot transmit without also causing interference (which would technically be intentional because you know it would interfere). I would personally prefer to avoid the interference. In such cases one might have no opportunity to ID at all within a limited time frame.

When it is clearly such a case, I suppose going QRP enough that you are confident you will not cause interference is as good as you can do then. But it should not be used when a full ID clearly is possible, nor to make your transmission effectively anonymous for part of the coverage.

If you ID QRP and then get back into the repeater QRO, you should ID again to make sure your transmission is ID as well as possible. I believe it is unfortunate that the FCC regulations really do a poor job of defining this.

If Communicators are limited to 220 MHz and above, most are going to end up on 440 MHz because of the equipment availability. This is going to wreak havoc with the 440 MHz private repeaters. The closed club repeaters would be a significant problem as long as the clubs don't practice any discrimination on the basis of license class.

I would suspect that most of these repeaters are controlled by CTCSS or DTMF access. With virtually all new radios having CTCSS tone generation capability for all standard tones, those repeaters controlled by CTCSS are going to end up being accessed anyway. The DTMF controlled ones with short access codes could see the same problems.

This will, unfortunately, also create even more bias against Communicators as a whole for the actions of likely just a few.

From the looks at the above stats, the 70cm band is just as crowded as the

2m band in major metroplitan areas (i.e. FULL). Every argument that uses fullness as a reason to exclude Communicators from 2m is just as applicable for 70cm. The only difference is that there are FEWER open repeaters on 70cm.

Maybe having Communicators on the "full" 2m band would cause problems. But squeezing them all (and this is where they would go, mostly) onto the "full and closed" 70cm band will just be worse.

The argument in the rural areas is different, since 2m is the primary band everyone uses and 70cm is used, but not by nearly so many.

This matter alone justifies allowing Communicators on 2m and 6m. Maybe it is not too late to file a petition to amend comments to the FCC in the Communicator issue.

> (Note that 'closed' and 'private' are rolled together: the former merely
> requires club membership which is open to any applicant; the latter is
> by-invitation only. They didn't mention any statistics on how many there
> are in each of these categories.)

It would be nice to see those differences. Maybe someone can encourage them to break the stats down a little better.

David.Stark,.NF2G@f218.n260.z1.FIDONET.ORG (David Stark, NF2G) writes:

> If you transmit on frequencies allocated to another service as a member of that service, then Part 97 does not apply to your communications at all. You are then bound by the applicable regs for the service you are using and the general regs for all radio users. The fact that you also happen to be licensed under Part 97 as an individual is immaterial.

However, you _assume_ the requestor of the mod info is _not_ authorized to do what he was asking to do. He might be, he might not be. To say he _is_ doing something he shouldn't be is making assumptions based on facts not in evidence (sorry, too much Perry Mason).

> In my *opinion* this is different from the case of a ham who takes his HT, which is only certificated for amateur use, and modifies it for out of band coverage for whatever reason. If he can get the radio certified/type accepted/whatever by the FCC for the additional frequency coverage, the radio itself is legal.

The radio itself is legal whether or not it is certified/type accepted for out-of-band. He couldn't sell it, but there is NO CRIME in posessing a radio with oob capability. Like mine, which covers all but is certified for one specific freq, is legal even when the tuning dial read 5686. Note I said posessing, not using.

> Then all he needs is a license in the appropriate other radio service OR authorization from a licensee to transmit under their license. That takes him completely out of Part 97.

If he ain't under Part 97, why all the quotes from it? In fact, no oob operation is covered by 97. Part 97 says what freqs you MAY use, not what you are prohibited from using. Anything oob is covered by other regs.

> Remember that this whole thing got started by somebody who

> stated he was trying to access non-ham repeaters with ham equipment
> and wanted advice on how to attain the odd split. Nothing in the
> message offered any evidence of type acceptance for his radio to go
> outside the ham bands, nor did he mention any authorization or
> licensure for non-ham transmission. If properly licensed outside of
> the amateur service, he could have simply contacted a service shop or
> the manufacturer for this info.

      ^^^^^^^^^^^^

I took that route, mainly because an entrepreneur who does the mod I
needed wanted $50 to do it. Kenwood, in their infinite wisdom, decided to
keep it a deep dark secret. I had to fax them my licensing info TWICE and
make several calls over a 5 week period to pry the mod info from their
fingers. They couldn't just tell me "chop R34" (not the right number,
don't chop it in your radio and expect it to work anymore). If I had had
access to rec.ham-radio, I would have asked here. If I had gotten the
response that the other fellow got, I would have walked away from this
group.

>Even if he simply preferred to ask
> fellow hams for advice, mentioning the above might have made life
> easier.

For whom? He asked a simple question, expecting a simple reply.
Instead he got told "I don't think you should do what you want. I don't
know what you want to do for sure, but it surely must be illegal."

>   The beginning of Part 97 (Basis and Purpose) mentions "self
> policing" as one of the traits of the amateur service. I don't think
> any of us take that to mean playing radio cop with each other. I do
> believe that it obligates us to at least try to keep each other out of
> trouble.

Unfortunatley, we have already decided that what he wants is not
covered by Part 97, so self-policing doesn't apply. This country was
started by people fleeing from situations where their neighbors were just
trying to keep them out of trouble. "You're worshipping the wrong God,
you gotta worship mine or you are in DEEP trouble." In other words,
individual responsibility still exists. I can't blame Yaesu for making
oob operation so simple when the Feds knock on my door. If my neighbor
wants to leave $20 bills on the sidewalk, I can say "are you sure you wanna do
that", but not "I prohibit you from doing that, so I won't even tell you
where the sidewalk is." If he wants to drive 80 MPH in a school zone, I
can't stop him.

This is my signature. It doesn't contain my name at all!

randall@informix.com (Randall Rhea) suggests:

>>Fewer families are able to buy a house now than at any time since the
>>Great Depression. This forces most of us to live in an apartment, or at
>>best a condo. Putting up a good antenna for HF is almost impossible in
>>these environments. Even if you can put up an antenna, TVI (and especially
>>VCR-I) is so severe that it's sometimes pointless, unless you want a lynch
>>mob after you.

>>What does this mean? Base station hamming is on the wane. You will notice a
>>large number of mobile HF stations, especially on 10 meters, and I think the
>>trend will continue. CW is not a medium that is suited to mobile operation.

Well, I've seen some weird anti-CW reasoning on this net, but this is a new one on me! I've worked quite a few /M stations on CW, including someone running 50 watts driving to work in Tokyo (egads). I also remember a long CW chat with K5NA who was driving to Florida and was glad to have someone to keep him awake for a while during the drive.

But allow me to come to the opposite conclusion. If you think you are going to cause RFI then you certainly ought to go on CW! It's not quite like using AM, which is decipherable, but even SSB RFI will lead the neighbors to suspect a human at work (or at least a ham), while all those "pops" could be anything. When I was in Israel last year I saw some ham antennas that shared a rooftop with TV antennas (and many of the 4X population watch TV from JY as well as 4X, so this isn't strong-signal stuff), and when I asked some of the hams how they avoid interference they said that (a) they tend to operate late at night, and (b) they use CW a lot.

You want another reason to use CW? If you are interested in working DX (or is that a dirty word around here too?) you have to be very masochistic to do it entirely on SSB. Tonight was a good example - in a short time tuning around the HF bands, I found 3 DX stations that I was interested in working. One of them was in Mongolia, JT1BR on 15m CW, I called him once and worked him. The next was Sri Lanka, 4S7CF on 20m CW, I called him once and worked him (OK, there were others calling both of these guys, maybe 3 or 4 people that I could hear). The third was Narau, C21DX on 10m SSB. The guy was swamped with callers, he had to go by call areas to reduce the crowd. He asked for people from the 3rd call area, many 3s called but lots of 6s, 2s... Some just called and called and called, even while the guy was talking. Others got on frequency and told them to shut up, people called each other names, other people told them to shut up, meanwhile the C2 was working someone but I couldn't hear most of his transmissions. I made a few calls when the guy was listening but even if he'd come back to me I wouldn't have known because of the lids still calling him. Maybe C2 is rarer than JT and/or 4S, but I remember working C21XX on CW when I was the only person calling him, and the latest "most wanted" list I saw had Mongolia among the top hundred countries wanted, but neither of the others.

This is not atypical. There are large phone pile-ups for pretty common DX (there were many more people calling a Uruguay station on phone than there were calling the Sri Lankan and Mongolian on CW combined. There are some fine phone operators but there are many many LID operators on phone who spoil the fun for me a large fraction of the time.

And yes, I know that not everyone likes working DX, but if you do then it is silly to do it on phone all the time unless you like beating yourself over the head for relaxation. I'm getting pretty tired of all the bleating about CW on this net, and the put-downs that result when anyone makes a reasoned argument for using it. I don't feel any need to apologize for liking it, any more than I do for preferring Bach and the harpsichord to rock music. In fact, I don't know why I'm even mentioning the advantages, the more people who find out about them the more crowded the CW sub-bands will get and the more the lids will cruise by to spoil things for us.

I feel much better now.

This is a subject Near and Dear to my heart. I have helped almost 100 people get their Nov and Tech licenses.

Here's the best suggestion I can give: get the book from the ARRL,

(Proceedings of) _The_ARRL_Nat'l_Educational_Workshop_

It has 25 papers discussing different teaching techniques
(one of which is mine, ahem!). It's available from ARRL for about $10.

I tried to distill what I learned from 5 yrs of teaching into 10 pages.

Hope this helps!

I've been getting more and more interested in the whole amateur radio
thang, but I'm not sure how to proceed. I picked up a copy of CQ (?)
and it was, despite all my engineering intuition, utter gibberish :-)

Are there books on the subject that are widely available?

I looked in the phone book, but was unable to find an a listing for any clubs.
Is the usual procedure to latch onto a mentor for a while? Anyone in the
Portsmouth NH area feeling the need to teach? :-)

I think that I'll be mainly interested in the computational aspect (i.e.
packet BBS, getting weather satellite data, that sort of thing) but then
I've never tried it so I'm open to trying anything.

It was only a matter of time... once I saw the pictures of the equipment
with lotsa dials and das blinkenlights, I was hooked on the idea! :-)

tank ewe

As both a ham and a city councilman, the above is not quite as simple as that. Antenna restrictions can be instituted by a city/municipality for valid and defendable reasons. An outright ban on ham antennas would likely be viewed as arbitrary and capricious by the courts, BUT a restriction can be justified on the basis of safety and zoning. For example: It doesn't take much effort for a city to defend a height restriction that incorporates verbage to the affect "No antenna shall be installed that if it fell from its base would extend beyond the property line of the owner." Clearly, if I then happen to live on a lot that is 100' by 100', the maximum antenna height I could install would be 50' if I installed it in the exact center of my property. The closer I wanted to locate my antenna to any one property line, the lower the allowable height.

Now you may not agree with this, but a similar "law" is in place in a local municipality (not mine) and will probably not be challenged, and if it is, the challenge will not (IMHO) be won by the ham.

Short of banning ANY type of general coverage receiver, I can't see what outcome any pressure would have on the radio listener, be that an swl or simply someone that has a radio. At this point, there must be millions of very broad coverage receivers in the hands of the public (Both regular types and scanners). Are we to expect confiscation? Legislation limiting future receivers/scanners manufactured from being able to receive certain frequency ranges (that's done now with the cellular on scanners, but it's a simple task to modify most of those scanners after ownereship.)?

At some point, if there is a call to restrict receiveing of a multitude of frequency ranges and specific frequencies, it becomes (IMHO) almost impossible to design a cheap scanner/receiver. Note also, the use of the radio spectrum is not static. What you find in a particular frequency range today may not be the same 10 years from now.

So what's it all mean? Again, IMHO, I really doubt that much will happen in the area of prohibiting general coverage

receivers or significantly limiting multiple ranges of
frequency coverage. Having said that, it does remain incumbent on
all of us, hams AND swlers to remain vigilant and sound the
alarm immediately at even the first sign of any such global
restrictions in equipment design being instituted.

Jim...you wrote

>why would any decent person WANT to
>eavesdrop on the private lives of others?

Probably because it's more interesting then the garbage on TV!

Seriously...What I hear and see in the privacy of my own is no ones' damn
business!   What I may do with it is!

Everyone is missing the point here...Encode the damn transmission and the
privacy issue is mute.

Now if we can get them to clean up their signals and put in shielding
everyone (except maybe the manufacturers) will be happy!

You don't. They don't want to hear it. They believe what they want
and ignore the rest. I have a brother, well educated, an Engineering
degree, not naive about radio. He has one of those stick it in your
ear and walk around cordless phones. He is also convinced that it
doesn't radiate beyond the confines of his house. He knows what radio
is, but is convinced that the phone was manufactured to protect his
privacy cause the owners manual says so. But then, maybe he is naive.
The point is, even though I can pick up cordless phones from as far
away as 15-20 miles on my 6 meter rig, you still can't convince the average
consumer of that fact.
I have given up trying. But I don't and won't have a cordless phone in
my house.

You might consider donating them to one of the following museums:

Museum of Communications (Dallas, TX) [might be deductable]

Southwestern Bell Museum (Dallas, TX) [just try and deduct it!!]

While both of these have a lineup of 14/15/19/26 machines, I'm sure they need parts, cuz their machines _work_. I think SWB might have a museum in Houston, too.

>Moreover, there is the fundamental issue: why would any decent person WANT to
>eavesdrop on the private lives of others?

This is an excellent example of how asking the question will
influence the response. The fundamental issue is NOT whether
decent people want to snoop on others. Rather, its a division
in philosophy between freedom and privacy. On the one hand,
people are generally ignorant about the technology they use.
As I recall, many congressmen were stunned to find out that
anybody with a Radio Shack scanner could listen in on the
cellular conversations. That realization (plus a little
high power bribing -- no *campaign contributions* -- from
the cellular industry) led to the ECPA. On the other hand,
this country has (at least historically) prided itself
on its emphasis on individual freedom. Virtually
unenforcable laws like the ECPA are an attempt to restrict
one's freedom, something that most Americans still
value pretty highly. I like to pick up a copy of Orwell's
_1984_ and reread it every few years. Partly to enjoy it,
but partly to remind me to keep my guard up against
our benvolent government (grin). Freedom is hard to win
and easy to lose; one minor loss leads to another, which
leads to another, and so on.

Drew

I was listening to HF last night and as I scanned through the 6mHz area the radio stopped on what sounded like packet transmissions. I hooked up my handy-dandy PK-88 and set it for 300 baud and lo and behold packet headers started showing up. The only problem is I don't recognize the calls that I am seeing. I suspect they are MARS transmissions but I'm not sure. Here is an extract:

Lauren has NEVER come back and said why he wants this split.
I'll bet he's just laughing at the commotion.
Maybe the rigs are going to be used in some country where
type-acceptance is not necessary. Maybe they're going to be used in a
service where type acceptance is not necessary.

Feh, now back to the flames in progress.

Errr..ahhh....yeah they did. Please refer to this month's QST(I think
in the "Happenings" section) for an illustration. An Arizona Appeals
court has upheld a lower court ruling that threw out a nuisance suit
against an amateur for causing TVI. The court held that TVI issues
were exclusively the jurisidiction of the FCC and action by the FCC
was the exclusively remedy to such problems. This has been the
position of the FCC for quite awhile(and this isn't the first such
suit.)

>I suppose there may be apartment complexes and homeowners associations that

Oh there are lots of these....they usually don't go after the transmitter,
it's nominally that unsightly antenna they try to get after...

> some stuff deleted...
>Yes, homeowners associations can, and increasingly often do, ban antennas
>or place height or type restrictions on them. Their authority is a deed
>covenent that runs with the property and is transferred to the new buyer
>if you sell the property.
>
>City governments can do the same, however, using PRB-1, these restrictions
>can be overturned or relaxed. Note that PRB-1 doesn't apply to deed
>restrictions.

All true....note further that PRB-1 isn't going to be sufficient to
completely rid you of antenna restrictions....they just have to be

"reasonable," i.e. they have to allow you to communicate. Several cities have enacted restrictions at say 55' or 65' that hams in the community have helped craft. These are usually reached as a compromise solution.

>of bare-wire dipoles. What does the numerator change to if the wire
>is insulated?

In practice, the insulation has very little effect - including it in your calculations wouldn't make enough difference to worry about, as you're still going to have to cut long and trim to resonance. Surrounding structures and height-above-ground affect the final resonant length so much more than wire diameter or insulation that dipoles are always going to be a "cut-and-try" proposition.

Remember, the 468/f formula is a *approximation*; you shouldn't expect it to give you an antenna that is exactly at the right length for your installation. For example, at 7.2 MHz, the formula gives an antenna length of 65 feet. That's almost exactly 95% of half the free-space wavelength, so it's a pretty good "first cut" - but I'd still measure off more like 70 feet of wire (to allow plenty of extra for tying to the insulators, etc.) and then start cutting and watching the meter.

One trick I used for a dipole was back in my Novice days when my parents house was on a lot with two phone poles spaced about 70' apart. (Y'see, the previous owner was a ham who worked for the phone company.) Anyway, I built the dipole and laid it out on the ground, then hauled it up to the tops of the poles via pulleys I'd mounted up there. To trim the antenna (and later, to do any maintenance on the cable, etc.) all I had to do was untie the ropes at the bottom of the poles and lower the whole thing back to the ground.

Here is the latest call sign allocation scheme from the 1989 FCC rule book:

Group A (Extra)	Group B (Advanced)	Group C (Gen/Tech)	Group D (Novice)
K#$$ *	KA1$$	K#$$$ *	KA#$$$-KZ#$$$
N#$$ *	KB#$$-KS#$$	N#$$$	WA#$$$-WZ#$$$
W#$$ *	NA#$$-NZ#$$	W#$$$ *	
AA#$-AK#$	WA#$$-WZ#$$		
KA#$-KZ#$			
NA#$-NZ#$			
WA#$-WZ#$			
AA#$$-AK#$$			

* = Call signs using these prefixes not currently issued.

Group A notes: The following prefixes will not be assigned to stations in the contiguous 48 states: AH KH NH WH NL AL KL WL KP NP WP AP. Pacific-area stations will be assigned AH#$ KH#$ WH#$, then Group B. Alaska-area stations will get WL7$ KL7$ NL7$ then Group B. Atlantic-area stations will be assigned KP#$ NP#$ WP#$, then Group B.

Group B notes: KA prefixes will be assigend only to persons living in the 1st call district. Other KAs are assigned to US personnel living in Japan. The following prefixes will not be assigned to stations in the contiguous 48 states: KH KL KP NH NP WH WL WP. Pacific-area stations will be assigned calls in the format, AH#$$, Alaska-area stations, AL7$$, and Atlantic-area stations, KP#$$. Once Group B calls are used up, Group C calls will be issued.

Group C notes: Pacific area stations will be assigned KH#$$ NH#$$ WH#$$ in that order, Alaska-area stations KL7$$ NL7$$ WL7$$; Atlantic-area stations NP#$$ WP#$$. After these are depleted, Group D will be used.

Group D notes: The following call sign formats will not be assigend to stations in the contiguous 48 states: KH#$$$ KL#$$$ KP#$$$ WC#$$$ WH#$$$ WK#$$$ WL#$$$ WM#$$$ WP#$$$ WR#$$$ WT#$$$. Pacific-area stations will be assigned KH#$$$ WH#$$$; Alaska-area stations will be assigend KL7$$$ WL7$$$; Atlantic-area stations KP#$$$ WP#$$$.

Hi Wally;

I'd suggest using the 400 hertz fileter   ter. I had a n HW-100 from 1969 through 1983 and had updated it with all of the mods of the HW-101, which came out later (I worked for Heath for a while, so it made it easy!). The 400 hertz filter gave a really "peaked" response and also rang a bit as any filter this narrow normally does. Unfortunately, the original design of the 100/101 set up the rat dio to transmit 1000 Hertz away from the receive freu quency, so the peak on the 400 hertz filet ter was set up at an audio tone of 1000 hertz. I changed mine to a more m pleasant 700 hertz by chag nging (I think) the CW BFO crystal up or down 300 hertz.

By the way, the 101 had a switch to go from the ssb to cw filet ter that was an add-on to the 100. It fit in back of either the RF or AF gain know b , and was a mechanix cal lash up to throw two cheapie slide switches to select the appropriate filter.. You might want to see if you could borrow a 101 manual, get the parts numbers, and call he Heath for   parts department to see if they still have it in stock (the parts for it, that is; I don't think it was an assembly). I'd also check for availability of the 400 hz filter, which is f available is probably cheaper than the Fox-Tango. Also, there is not any reason that would prohibit you from mounting two small relays (SPDT) in the vicinity of the filters underneath the chassis, and putting a SPST toggle w switch to activate them on thr e front panel. I do not suggest using one DPDT th relay, because you really want to isolate the input and output of the file ter by 60 db or better for best performance. The impedance here is 2000 ohms, so keep the leads short. Otherwise, at 3395 khz, the wiring is not all that critical.

Good luck on your project.

John, WB4LNM

|> to fall back on.

Yes, tuning is one consideration. I just got a used TS-440S that has
Fox-Tango filters in it (the guy who owned it wanted REALLY good filters).
Fox-Tango filters have much higher Q and steeper skirts than the standard
Kenwood filters, and this guy wanted the steepest skirts he could get.
He got 'em. He also got filters so good that they're subject to ringing
if the incoming signal's too wide. Therefore, you really want a wider
filter. At 250 Hz a clean CW signal will just about fill the passband,
and it might sound awfully peculiar.

Of course, if it DOES work right, and if you can tune the radio with
the filter switched off, you may have better copy from the 250Hz filter.

I'd say your best bet is to try to get some time on a radio that's got such
a filter, and see what it sounds like. Those narrow filters sound awful damn
strange, but if you can get past that you may actually find that you
like it.

Text edited.....

In Denver, the old individual radio systems of each agency are being replaced with a new, shared, trunking system...

All the police, fire, parks, trash, water, etc., will be using one

40 channel system...with computer controlled dynamic channel allocation. This means it will be very difficult to follow a thread of a conversation as the conversation will keep jumping to a new channel every time one party unkeys and the other keys up. Part of the justification is to make it real hard for our crack dealers to monitor the police with the $89.00 scanners. There is also the option on the trunking system for various types of encoding or scrambling.

As mentioned above, the city is providing units to the major TV and radio stations...as well as the vultures (tow trucks). There have been a couple of instances where a TV helicopter has really helped nab some criminal or helped find someone lost...so they have justified their need to the city administration.

It seems to me that if someone broadcasts their private life, either by voice (yelling) or by electronic means (PA system, radio waves) then they have no right to complain when others "listen in".   It's rude to expect others to turn a deaf ear to your excessively boisterous lifestyle, eh.

Heard a commercial on the radio for Coors beer. In this commercial, you hear
a fake DJ and fake jingles for radio station "HOWL". (Coors is advertising
beer for Halloween parties). Just curious what country radio station HOWL
would exist.

I once heard someone claiming on the air that he modified his TR2600A
to receive the 162.55 weather band. He also alleged (never saw it confirmed)
that he hacked the Digital Coded Squelch modem (which he and I have
never used yet for true DCS) to detect the single warning tone

sent out by the weather service and to keep the radio quiet (as
DCS does) until it hears the weather alert tone on 162.4, .475 or .55
In any case, I tried for months to pry it out of him how he did it all,
sent him enlarged-xerox schematics with return address/postage
envelopes etc. etc. but he never came through. I personally never
saw it in operation but a friend of mine did.
I too would be interested in at least opening it up to 162.55 receive.
One thing I did do in frustration one night was to go into the
diode matrix of 3 or 4 diodes that I know affect ranges of TX/RX
and tried every permutation of them connected or disconnected
(8 or 16 of them) resetting the microprocessor
every time in between to see what it would do to the radio. I got
such results as: Turned it into a European version (TX/RX 144-146)
Made it TX/RX 140-160, made it stock-american (RX 140-160, TX 144-148)
and several combinations caused other unusual limitations, generally
a subset of TX/RX but always between 140-159.995 (where I said 160
I really mean 159.995).
If anyone else figures out how to extend this radio's RECEIVE to 163,
I certainly would like to know (and the net I am sure would like to know
so they can discuss the illegality of opening the transmit to 163 so one
can do their own illegal weather forcasts on 162.55 (just kidding)).

It has been quite a while since I have seen the NASA style
satellite orbital elements posted. Are they no longer available?
Is there an FTP site where this data is available? A logical
source would be the ames.nasa.gov site which supplies near daily
updates on other launch information, but it doesn't appear there.
You would think that as important public image seems to be to NASA
that they would provide such information as a public service to

those who enjoy tracking the birds.

Also, does anyone know of an up to date source of the frequencies used by the various satellites? I have a book with an extensive list, but most of the birds listed are no longer active.

>the maximum antenna height I could install would be 50' if I
>installed it in the exact center of my property. The closer I
>wanted to locate my antenna to any one property line, the lower the
>allowable height.

The allowable height in the above example would probably be more like 30 feet because you have to add the half-diagonal dimension of the beam to the tower height to obtain the worst-case reach (if the beam and tower fall flat).

>Now you may not agree with this, but a similar "law" is in place in a
>local municipality (not mine) and will probably not be challenged,
>and if it is, the challenge will not (IMHO) be won by the ham.

It is unfortunate that regulations like this must exist -- There are no "absolute" guarantees of safety in life. If extended, this would make it difficult to build fences -- by definition their height would be limited to zero when placed directly on the property line. I'd bet that a ham with enough money could beat that regulation.

The regulations regarding tower height limits would be much easier to defend in court if they were reasonable -- eg the owner of the tower high enough to present a danger to his neighbors property should have the design engineered and carry insurance in case of incident.

I am looking for a simple modification to run my Kenwood 530s on 12v DC.
I have a couple of bulldozer batteries sitting around and thought it would
be practical to have emergency power around. Any other modifications for
this rig I would appreciate also.

I use coax on X-band a lot. It is that really small "hardline", with
SMA connectors. There are a couple of sizes of the semi-rigid stuff; I
don't have the RG numbers, because I've gotten all of mine at swaps.

Another issue about 'identification' is loss of power because your
HT battery dies in the middle of a QSO. Obviously, there is nothing
you can do about it!

In article <1990Oct16.133310.1130@cbnews.att.com> wrb@cbnews.att.com (Wallace R. Blackburn) writes:

>I have a Heathkit HW-100 that I use almost exclusively for CW (yeah, yeah I know). I picked it up used (no kiddin') and it has the SSB (2100 Hz) filter in it. I've found filters available from Fox-Tango and I think I want to get one. My question is this: they have 400 Hz and 250 Hz filters - do I want the tighter one, or are there tradeoffs between tighter filters and wider ones (i.e. is it difficult to tune, etc.) There is no provision for switching between two filters, so unless I rig something up, I will be stuck with whatever is in there.
>

Ugh! What a choice! I think you're going to want to go for the "rig something up" option. I have a choice of 2400Hz, 500Hz, and 250Hz. The "no filter" option is, as I'm sure you're aware, good for absolutely nothing. If I had to live with only one of 500Hz or 250Hz, I'd probably take the 500Hz. With a bandwidth that wide, you can tune and find the guy. It's OK up until you get into contests or a pileup, and then it gets pretty rugged trying to pick out the one signal you're listening to out of the thousands that creep through that 500Hz hole. With 250Hz you cut the window down significantly, but I've found it extremely difficult to tune with my 250Hz filter on. I will take a guess that your 400Hz choice will be the one you want. HOWEVER, this all depends on how wide the filter skirts are. For a while, I operated my rig (an Icom 761) with a 250Hz filter in the second IF only. That was tunable, since the skirts of the filter were not exceptionally steep. But when I added a first IF filter, the skirts became much sharper and it became a lot harder to tune. Even tuning very slowly, I go right over weak stations and never even hear them. Go into your nearest dealer and play with an Icom 781 (which has the 250 Hz filters built in, rather than as an option like the lower-priced stuff). That will give you a feel for tuning with steep 250Hz filter skirts.

I disagree. Go ahead and transmit out of band and see WHICH FCC regulation you will be charged with violating? They will probably charge you with several, but 97.301 will be one of them.

And what is the 100 foot loss for that coax at 10 GHz?
I bet it's not good enough to make a run up the side of
the tower. It should be fine for interconnecting
components.

=========
SpaceNews
=========

MONDAY OCTOBER 22, 1990

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States.
It is published every week and is made available for unlimited distribution.

* ULYSSES NEWS *

Flight controllers began turning on Ulysses's nine science instruments on Friday. All onboard systems are operating normally. The second of two Trajectory Maneuvers is scheduled for 02-Nov-90, and will make final adjustments in the spacecraft's flight path on its way to Jupiter encounter in February 1992. Ulysses was deployed by recent U.S. Space Shuttle mission STS-41 on a five-year mission to study the Sun's poles and interstellar space beyond the poles as well as study the planet Jupiter.

* PIONEER 11 NEWS *

A spacecraft emergency exists on Pioneer 11. Downlink signals from Pioneer 11 have become variable in strength. The problem could be caused by a problem in a driver amplifier in the satellite's transmitter. Downlink received by the 70 meter antenna in Australia is in low noise configuration, and the receivers are locking up for 3 to 4 second intervals. On Tuesday, commands were sent to the spacecraft using 70 meter antennas in Spain and Goldstone along with 400 kw transmitters. Receiver lock with the 70 meter antenna in Spain remained intermittent and no telemetry was received.

* GALILEO NEWS *

Galileo's 1200 bps high rate engineering telemetry data was successfully received and processed last week using both 70 meter antennas in Goldstone and Australia. Spacecraft performance continues to be excellent.

* HUBBLE NEWS *

The Hubble Space Telescope will be used to study a very large storm which has suddenly developed in Saturn's atmosphere. The Washington Times reported that an oval-shaped white spot, one and one-half times as wide as the Earth, has formed in Saturn's cloud belt. Reta Beebe at New Mexico State University reported that two smaller white spots have developed along with the huge oval spot and that the three spots together cover nearly one third of Saturn's surface.

> ...fire departments and ambulance crews deal with emergencies all the
> time... Does that mean they can routinely use ham frequencies...

Of course not. They have frequencies allocated for the purpose. The two situations -- EMT on ham freqs, ham on emergency freqs -- are not symmetrical.

Now if an EMT needed to use a ham freq for some reason while dealing with a "routine emergency", I'd be all for it. The emergency might be routine (for the EMT), but his/her use of ham freqs would not be -- and it would be justified in a bona fide emergency.

> Your response is that of a well educated young engineer. That by itself does not make it wrong, but there are certain questions of perspective you might consider.
>
> First, although you are representive of the average participant in these newsgroups, your good ol' boy from Texas in all likelihood is not terribly far removed from the statistical mean of scanner listeners in general, who are mostly pretty ordinary blokes. In that sense, the interview was probably not as biased as you would like to believe.

You can interview someone who is the statistical mean of a group to see what makes up the group. You can interview someone who really knows the issues involved and has prepared the case.

CBS (apparently) chose to use ONE method for ONE side, and another method for the other side. To have been fair to the good ol' scanner buddy, they should have interviewed the average NON-scanner for the opposing side.

Or, instead of interviewing the good ol' scanner buddy for the scanner side of the issue, they could have interviewed someone who knows the issues from the scanner perspective, someone such as Bob Parnass.

The interview definitely was unfair because they expected the AVERAGE person of one side to argue effectively against an educated person of the other side who likely has already researched along the lines of his personal agenda.

Sorry, Jim, you make a poor defense of CBS by claiming that the chosen scanner listener is average.

> Second, I think your description of the origins of the United States leaves

> sociologist's views.

The right to expect privacy has not changed. Too many people are coming to accept the intrusions of government into their lives, as people have in other countries for centuries. The right of privacy, as are many other rights in the U.S., is fading. That risks a re-revolution to reinstitute what we got in 1776 and lost since.

> Finally, the anthropological concepts regarding territoriality come into play

That is certainly a case of one group against another, and a democratic process alone will usually end up favoring the majority. That does not mean it is right, it only means it happens.

The only way for democracy to work is for those who are participants to be fully and accurately informed. The CBS interview served to DISinform the public, which EXPECTS to see an informed representative of an issue argue the merits of such an issue.

You are evading my question. WHY do people want to listen to baby monitors,
cordless telephones, etc.? WHY do people want to pry into other people's
private lives? Hang the legalities. What is the motivation to do it, legal or
not?

It asserts the authority of the federal government. It serves as a
guideline for the courts and a basis for federal courts to take jurisdiction.

> I suppose there may be apartment complexes and homeowners associations that
> have attempted to ban the use of ham transmitters, but I've never heard
> of any.

Winfield Village Cooperative, Savoy IL. The defendant was an unemployed
Hispanic and there are some suspected overtones of racial discrimination
in the issue. Even after the two original complainants moved out, and
the coop board's contracted investigator found nothing wrong with the
ham station, they pursued it anyway. The case is turning around because
of turnovers in the board. They argued that the basis was a clause
against "causing a nuisance".

> Unfortunately, the restrictions are disclosed to you before you sign the

> As both a ham and a city councilman, the above is not quite as simple as that. Antenna restrictions can be instituted by a city/municipality for valid and defendable reasons. An outright ban on ham antennas would likely be viewed as arbitrary and capricious by the courts, BUT a restriction can be justified on the basis of safety and zoning. For example: It doesn't take much effort for a city to defend a height restriction that incorporates verbage to the affect "No antenna shall be installed that if it fell from its base would extend beyond the property line of the owner." Clearly, if I then happen to live on a lot that is 100' by 100', the maximum antenna height I could install would be 50' if I installed it in the exact center of my property. The closer I wanted to locate my antenna to any one property line, the lower the allowable height.

Basing a restriction on safety and zoning is just what the city should be there for. But safety also follows TECHNICAL matters as well. For instance a properly designed and installed tower, kept in good condition, will NOT fall flat over. The height limit on a tower that can be shown to be in good condition by a competent engineer could be SAFELY placed MUCH higher than its distance from the property line.

I personally would call a rule that places a limit of height equal to the distance to the nearest property line to be "arbitrary and capricious" unless it designates this limitation only for towers not found to be in good engineering condition. If a certified civil engineer signed off on the tower as not able to fall more than (say for instance) 1/2 its height from its base, then your could have that tower up to 100' without danger of it falling on the neighbor's property (from center).

I believe it would be reasonable, and quite likely a good idea, to require the towers to be certified by a competent engineer to be within reasonable safety margins (e.g. to not fall upon the property of another). Also, there are other safety concerns that need to be addressed as well. There need to be ways to prevent children from climbing the tower or from getting close to its base. Guy wires at ground level need to have an appropriate safety mechanism (clearly flagged or inaccessible). Towers high enough to pose a falling ice danger also need an appropriate protection from people getting hit by falling ice. Fencing an area around the base of the tower can be a good way to prevent the climbing and icing problems. All these things should be inspected as part of the finalizing of the permit to keep the tower. There also needs to be some regularity of the inspection to maintain

the degree of safety. The ham who wants the tower up should be expected to
pay all reasonable costs of keeping the tower in safe condition and showing
to the authorities that it is safe.

> Now you may not agree with this, but a similar "law" is in place in a
> local municipality (not mine) and will probably not be challenged,
> and if it is, the challenge will not (IMHO) be won by the ham.

How REASONABLE is that law? Does it have any "arbitraries" in it?

> space. I grant the right to determine if an RF signal entering my space harms
> me in some way. I doubt that that requires that I inspect the information
> contents of that RF signal.

Keep your personal space out of my personal space.

An enlargement of the person space would require first establishing the
concept that actual security of the radio transmission really exists.
It would be an invasion of my PHYSICAL personal space for you to determine
if I actually am listening in (and ONLY doing that). Such security does
not exist for signals transmitted in conventional emission modes and not
encrypted. Maybe we need more DES baby monitors.

> No, only the information.

Suppose you toss a sealed envelope into my front yard, which contains
pictures of you and your SO making love. Is that an enlargement of YOUR
personal space? Am *I* violating YOUR space by making an EFFORT (opening

the envelope) to get the information.

I contend that tossing the sealed envelope which has information in it is no different that tossing out electromagnetic waves that have information in them. If you toss them MY way, I am CAPABLE of opening either, and you have effectively given up your right to privacy.

You COULD have setup a wire-based baby monitor. In fact the intercom system in the house I grew up in had a way for the master unit to listen in on anything going on near the slave unit. You don't NEED to transmit over the radio but you simply CHOOSE to.

Also, it is nearly impossible to be able to detect the signal without also detecting the information. Of course that is decreasing with technology.

> transmissions is forbidden. ("That's rude, old boy!")

Strange, but the U.S. is one of the very few places where people felt this way enough to revolt against an authoritarian regime and establish the greatest democracy the world has ever seen.

Strange, but the U.S. is one of the very few places where we have a diverse set of constitutional freedoms based on the concept that the government has no more authority over people than the people themselves do.

Strange, but the U.S. is one of the very few places were have a reasonable expectation of privacy of the things we do in our own personal space.

Dispatcher's fault, but that's no consolation.

> Hams do have access, but it might not be properly identified, and that
> might cause problems in some (rare?) cases.

Well, that's really the center of the problem. The proper identification of the caller's location is the heart of ALI. That is why I mentioned access to E[nhanced]9-1-1.

> What do you normally get to find out about a call?

On "normal" landline calls, the small LED display gives an immediate readout of the originating number. The number information is also sent to the telco's billing computer for matching with the address info. The response from the telco computer is sent back to the PSAP and displayed on a CRT. This information can be imported to the CAD event mask by keyboard command.

That is how the system works in Rochester, NY. Your mileage may vary.

> What would you think would be best to see in place of (or in
> addition to) that information to properly tell you about a ham
> repeater/autopatch that
> has coverage over a wide (possibly multi-jurisdiction) are?

That information in itself _should_ be sufficient. But it needs to be coupled with proper orientation of the complaint takers and reiterated during ongoing staff training. In my experience, ham calls via what is locally called the "Fuzz-Buzz" are relatively uncommon. Operators tend to forget procedures that are rarely used, so they need to be reminded.

> I think Tad's "solution" was a reasonable TEMPORARY one to deal with the
> "mismanagement" that appears to exist in his jurisdiction.

I concede that. Hey, Tad! I've been thinking about your situation. Did you say you were in Seattle, WA? Last I heard, the director for Seattle's center was Alan Komenski (formerly Director of the Monroe County OEC here in Rochester, NY). He is also known as AC2K and I would think he would be more responsive. Has your repeater group talked directly to him?

> > I would like to see a copy of this alleged mail. I sent no such

OK. They do seem to be separate issues. Separating the possibilities this way seems to reveal more basic agreement on what we are saying here.

> That is *IF* the ham is going to use the radio in that service.
> This would apply just as well to a NON-ham who has ham equipment.

Also agreed.

> Just picking nits here, if the "ham" was going to be operating ILLEGALLY
> in another service, it would NOT fall under Part 97 Basis and Purpose for
> self policing. You could just turn him in to the FCC or you could just
> forget it. On the other hand you may have done him a favor by telling him
> that he might be setting himself up for legal problems.

I guess it would depend on FCC's interpretation of which exact regulations they wished to enforce in a particular case. If the person doing the transmitting were a licensed ham, I suspect they would be likely to invoke Part 97 along with any other charges. In fact, the FCC rules allow them to take action against ANY licenses in ANY service held by someone found guilty of an infraction.

I would prefer to keep a fellow ham from losing his license no matter what set of FCC rules would be used to take it away. My intent was undoubtedly obscured by the overzealous way in which I presented the warning.

Those must be the extra signature graphics that somebody netmailed me a complaint about. They do not originate at my system. I use a simple FidoNet origin line which is stripped out and replaced with the origin line of the system that moves the echomail across the UUCP/FidoNet border.

```

Apparently it did. I will drop the ",NF2G" in future logon sessions here. Thanks for pointing it out.

>
> This is just TOO much!

Everyone who needs to call for emergency service has access to the E9-1-1 system, EXCEPT HAMS. This looks like a problem to me.

> Problem: When dialing 9-1-1 from the repeater autopatch, the repeater location shows up on the screen at the 9-1-1 center, which could POSSIBLY (not likely) confuse the operator.

Yes it could, unless the ALI was modified (I've seen it done - I have worked in a real, live E9-1-1 PSAP myself) and the operators were properly trained.

> The solution is to eliminate the ALI (Automatic Location Identification).

Wrong. The solution is to IMPROVE the ALI.

> Now Mr. Stark Raving Ham is PISSED OFF, because....well, no one's really sure WHY he's upset...he just usually is.

I have not engaged in any personal attacks, which is how "flaming" is defined. Care to describe the above comment?

> This guy actually sent me mail, saying he USED to think Seattle was an OK place before he read rec.ham-radio and found out what a LOUSY 9-1-1 system it has!

I would like to see a copy of this alleged mail. I sent no such message. Show me. Now.

Go read the Basis and Purpose of Amateur Radio at the beginning of Part 97 again. Among other things, it mentions "self-policing." You are requesting assistance to commit what may be an illegal act. I am advising you of same, in accordance with one of the many requirements of the amateur radio service per FCC rules. End of fight.

Perhaps another issue has crept in here that obscures the original argument. Do you transmit "out-of-band" as a ham or as an authorized member of an agency with operating authority on those frequencies? (I am assuming that, as you state, the equipment itself is legal re certification.)

If you transmit on frequencies allocated to another service as a member of that service, then Part 97 does not apply to your communications at all. You are then bound by the applicable regs for the service you are using and the general regs for all radio users. The fact that you also happen to be licensed under Part 97 as an individual is immaterial.

In my *opinion* this is different from the case of a ham who takes his HT, which is only certificated for amateur use, and modifies it for out of band coverage for whatever reason. If he can get the radio certified/type accepted/whatever by the FCC for the additional frequency coverage, the radio itself is legal. Then all he needs is a license in the appropriate other radio service OR authorization from a licensee to transmit under their license. That takes him completely out of Part 97.

Remember that this whole thing got started by somebody who stated he was trying to access non-ham repeaters with ham equipment and wanted advice on how to attain the odd split. Nothing in the message offered any evidence of type acceptance for his radio to go outside the ham bands, nor did he mention any authorization or licensure for non-ham transmission. If properly licensed outside of the amateur service, he could have simply contacted a service shop or the manufacturer for this info. Even if he simply preferred to ask fellow hams for advice, mentioning the above might have made life easier.

The beginning of Part 97 (Basis and Purpose) mentions "self policing" as one of the traits of the amateur service. I don't think any of us take that to mean playing radio cop with each other. I do believe that it obligates us to at least try to keep each other out of trouble.

I think that one has already been addressed. It comes under "serving the regular business interests" of the agency, or similar wording. In other words, we can't dispatch police cars on 440. That is the routine operation of the PD and does not really constitute "emergency" operation.

Perhaps we can turn up some documentation on when this issue was discussed and what the current interpretation really is.

As far as the "without a ham license" part, that is covered in the rules for THEIR services (Part 90) and would constitute unlawful

```
"out of band" operation on their part.

This is not true.  The Civil Air Patrol frequencies are MILITARY
(Air Force) frequencies and thus are not governed by the FCC.

It is legal to use non type accepted equipment on MARS and CAP
```

frequencies. It is NOT legal to use non type accepted equipment on public service and commercial frequencies.

On a slightly different subject, I have not entered this flame-war on calling dispatchers on a ham HT on purpose, because it has mostly been beat to death.

I personnally call our county dispatch quite often. I am a member of a recognized volunteer emergency group, have an assigned public service call, and have public service radio training. But, when I do call dispatch, I DO IT ON A TYPE ACCEPTED RADIO. Type accepted handhelds generally cost a little more than the equivalent ham stuff but are getting cheaper all the time. I can buy a KING mobile for not much more than a ham mobile, it will cover from 144-174 Mhz, has a REAL scanner, and a REAL priority, and does not suffer from intermod.

Regardless, If I were caught somewhere with a REAL emergency, without my type accepted equipment, outside of my recognized jurisdiction, and couldn't get anyone on the ham bands, would not hesitate to call the nearest dispatcher on my modified HT. BUT...that's a LOT of IF's don't you think?

Question:

If you are using a repeater, and you signal drops to the point of being unreadable to the repeater, how does one legally ID ? Just id on the input frequency ? just id on the output frequency?

...Wondering

I can't answer for the current crop of satellites, but I know that on Oscar's 7, 8 and 10 it made a difference. The Polar orbit jobs flipped about and a polarity switch was nice. KLM sells a polarity switcher, but the best deal is the polarity switching box described in the RSGB VHF manual - it also used to be sold by the VHF Communications mag people and J-Beam. This box lets you switch between RHC, LHC, Vertical, Horizontal, 45 deg slant and 135 deg slant. The box is manually switched in the shack and you need 2 coaxes from the antenna. I used this switch box extensively on Oscar 10. There were times when the best signal was slant polarisation. So, I suggest you make a switcher as per the VHF manual for best results and use the KLM LHC/RHC switch as a second choice. As I recall Crossed Yagis are made by J-Beam, Cushcraft and KLM, there may be others.

> Any views on the practicality of using an Alliance 110 rotor for
> elevation? (I have a heavy duty rotator already for azimuth).

I have used this setup. It works, I prefer the old Stolle rotators to the U-110. The Stolle has been sold as a J-Beam, RCA and Radio Shack. They had a bit more poke than the U-110. I havent seen a new Stolle since 1977, they do turn up at swap meets. There is a modification for the U-110 using selsyns as indicators in the September 1979 QST. Fair Radio Sales may even still have the parts.

My final note is the "Non Conductive Crossboom" question. PVC plumbing lacks rigidity as do many fiberglass poles. If you can get old pole vault poles they are nice. My best bet is a regular closet pole from the local lumber yard. Test them all to find the one with least flex. Use polyurathane varnish on the pole.

Lotsa luck. Maybe one day I will get an estanzia and put up more antennas.

You only need to identify YOUR signal. That the ID usually is heard on the repeater output serves only to identify you to those listening to the repeater and do nothing to identify YOUR signal. Therefore, IDing when you have dropped out of the repeater should be done on the same frequency tha YOU have been using, the repeater input.

ID your station on the input frequency. The fact that you are no longer readable on the repeater is not relevant; you should identify on the frequency which your station was transmitting. The same holds true on HF; if the station you are communicating with can't hear you any more, you still have to ID when you are finished.

If you are no longer readable then just say something like "WN4BBJ clear," you will be covered.

One consideration is that the HW100 doesn't let you run split
frequency at all. If you send CQ and the other guy calls back outside
your narrow passband, you can't retune to copy him without changing
your transmit frequency as well.

Other than that, if I had to choose between 400 and 250, I would take 400
for ease of tuning, especially since you don't have the ssb width filter
to fall back on.

This is a classic case of RF feedback. Use standard RF suppression techniques such as RF chokes in the AF leads (toroids ok, put the suppression as close as possible to the mic connector) and .001 caps to ground at the mic connector.

While you're at it, put suppression in the power lead to the TNC. Ground your
TNC to your station ground. Undo that fancy cable lacing and seperate your
cables.

>   -- N0KFB

Presumably the person you were talking to knows who you were, so whether your ID gets through the repeater is immaterial. You are supposed to ID your transmitter. The repeater is supposed to ID itself, which it will do whether you're making it in or not. So where's the confusion?

This article is partially reprinted without permission from the Sept. 24, 1990 "Electronic Engineering Times":

--
Dayton, Ohio - NCR Corp. has joined a small club of vendors seeking to sidestep the physical media debate in local area networks by proposing that users switch to a wireless LAN. At the recent NetWorld conference in Dallas, NCR introducted an interface card for "WaveLAN", a spread-spectrum RF LAN that uses an omnidirectional radio antenna in conjunction with a standard PC add-on card, providing LAN connectivity at 2Mbits/second.

[technical stuff deleted, incl. why infrared LAN's don't work -ed]

NCR has solved the security problem, at least in part, by offering encryption of LAN data using the Data Encryption Standard as an optional feature for WaveLAN. The signal, spread between frequencies of 902 and 928 MHz, provides additional security from interception. NCR has applied for eight patents associated with the wireless LAN technology. The IEEE 802 group of LAN committees has established a special working group, P802.11, to analyze wireless LAN standards, with which NCR is involved.

```

I took the Advanced test on October 14 and my exam answer sheet was scored showing five erroneous answers. Being well prepared for the exam, I asked to see the questions I missed as I found it hard to believe that I had five wrong answers. I only took the time to check three of the questions and found the following results. I marked one incorrectly (my own fault - I just missed it). In one case the answer key was marked incorrectly. I pointed it out to two of the examiners (both Extra class operators). They both looked it over and being non-technical types (answer memorizers), one agreed with me that the answer key was wrong, and the other guy couldn't handle the question at all. But they could do nothing as their hands were tied by the FCC rules and they recommended that I write letters to try to resolve the problem. In the third case, apparently the FCC rules had changed so both my marked answer and the examiner's answer key were incorrect.

My point is that if you fail an exam, don't take it lying down. Ask to see the questions you missed and make sure they really are wrong. It may very well be easier to take the exam again, after studying harder, than to try to challenge the results via a letter writing effort. But if more people complain about the clerical and technical errors present in the examination process, the more likely these problems will be corrected.

Good luck to you exam takers and fight if you know you're right!

The following rumors have already been posted. Notes users should be able to find them by using the lower case x function and entering 77 as the search string.

```
 ----------------------------------------------------------------------------
                     Kenwood TH-77 & Bearcat 200XLT mods       No responses
pvh@Apple.COM                   Pete Helme at Apple Computer Inc., Cupertino, CA
```

Anyone know if the new dual band Kenwood, the TH-77, is available in the U.S. or not yet. They're already importing the new smaller single band units (at least they've been advertising them).

```
 ----------------------------------------------------------------------------
```

Dear Pete Helme,

There is talk about bringing the TH-77 in the to US, but hold your breath for anytime soon.

Russ Black N6YFL

```
 ----------------------------------------------------------------------------
```

A call to Kenwood, 213-639-7140, yielded the following:

The TH-77 is a two band handheld. It will support cross band repeating. It will use all the current TH-25 accessories, e.g. batteries, chargers, except the cases. Advertisements should start showing up in November.

Suggested Price is $599.

Bill Thomas WB0ALN

I talked to the Kenwood rep at PACIFICON this past weekend. This is quoted from him (i.e., don't blame me):

The TH-77 will appear in the U.S. in about 4-5 months after FCC type accepting is completed. Price is unknown at present due to the current fluctuation of the Yen to the $. It will be packaged in a case something similar to the TH-26. It will use the same batteries as the TH-75/25/26 etc. It will support direct keyboard freq. entry, MR clear (a must for some). It is rumored to have dual 440 receive and it may do cross band repeat.

Edmund Scientific prices are a bit high.

Start with the recreational vehicle people and boating people for appliances that run off of 12 Volts (actually closer to 13 to 15 Volts). Check up on electric cars for information on what you can and cannot do with batteries and costs of batteries. Check also with farm and ranch suppiers for solar panels since some electric fences and water pumps are solar powered.

In general skip the energy conservationist sources who cater specifically to the Yuppie$ who want to maintain the appearance of socially correct lifestyle and check into those that cater to people who live or travel in remote areas and buy this stuff because they need to or because it is cheaper than the alternatives.

Before you start thinking that you are helping the environment, remember that battery chemicals, nickel, cadium, lead, sulfuric acid, and plastics as well as solar cell material and manufacturing process are not necessarily the best things either.

someone asked about J pole antennas, so from my files:

>From: kinsman@ektools.UUCP (Andrew A. Kinsman)
Newsgroups: rec.ham-radio
Organization: Eastman Kodak, Dept. 47, Rochester NY

The following is a description of a J-Pole antenna made from 300 ohm TV twin-lead. Quite a few of the hams in the area have successfully built one or more of these antennas. They have quite a few advantages which include improved performance for 2-meter HTs, portability, and last, but never least, they are inexpensive.

                     -*-
           solder the twin leads together at bottom
```

1. Start with 54 1/2" of TV twin lead (foam core does not work as well)
2. Strip 1/2" of insulation at bottom and solder wires together.
3. Measure 1 1/4" from soldered wires and strip insulation on both
   sides. This is the solder point for a coax feedline.
4. Measure 16 3/4" from bottom and cut out 1/4" notch on one side.

5. Feed with a length of RG58U coax. Tape coax at feedpoint to the twin lead for strength and weather protection.

I have also attached an alligator clip to the plastic on the top of the antenna in order to conveniently hang it. I am successfully using one in my attic to avoid any CCNR problems. I have another that I can take with me camping, sailing, etc.

This design has appeared on many BBSs and in club newsletters; the earliest reference that I know of is a Jan. 1984 D.A.R.C. antenna article by James Burks, KA5QYV.

Enjoy,
N6UBM

Of course the real question is can you copy the code in your head, have to write the letters down, or do you use the now disputed method of writing out the dots and dash do decode at your leasure. But wait!! Can the police dispatcher copy CODE?????? Do they have to pass a code test for a third class license??? My dear, Pandora's box is open full and all the snakes are out now!!!

On the filters, I have both a 500hz and 250hz in my TenTec. If the bands are not crowded the SSB filter is fine, if things are more active I like the 500hz. The 500hz is the filter I used most, it gives reasonable tuning ability and keeps the QRM at bay. The 250hz is only used during contest weekends or figthing the pileups on DXpeditions. The 250hz filter is very sensitive to tuning and is some what on the ringy-dingy side. Given a choice of one or the other, I would opt for the 400hz filter.

If I have offened the units GODS, please accept my humble appologies.
I don't known if the darn things are hz or HZ. Things were simplier
when they were cycles.

In article <1990Oct17.204646.19836@informix.com> randall@informix.com (Randall Rhea) writes:

>I have a couple of questions for those of you out there who have experience
>in this area:
>
>1. I have heard that recently all city ordinances involving TVI were
>declared unconstitutional, as this is the exclusive juristiction of the FCC.
>Can an apartment complex or homeowners association ban the use of ham
>radio transmitters?

I don't think the FCC has ever preempted TVI ordinances. They did, in PRB-1, preempt city antenna ordinances. The order in PRB-1 is a limited premption--it didn't declare anything unconstitutional, only a court can do that.

I suppose there may be apartment complexes and homeowners associations that have attempted to ban the use of ham transmitters, but I've never heard of any.

Unfortunately, the restrictions are disclosed to you before you sign the lease or sales contract, so any such restrictions are legally binding. Your best bet is to read the lease or contract carefully before signing away your rights.

>
>2. Can homeowners associations ban antennas, or place height restrictions
>on antennas? Can city governments go the same? I assume that height
>restrictions are OK.

Yes, homeowners associations can, and increasingly often do, ban antennas
or place height or type restrictions on them. Their authority is a deed
covenent that runs with the property and is transferred to the new buyer
if you sell the property.

City governments can do the same, however, using PRB-1, these restrictions
can be overturned or relaxed. Note that PRB-1 doesn't apply to deed
restrictions.

>3. What can hams do to fight against such rules?
>--

In the case of homeowners associations, there are several routes:

1. Apply for an exemption with the architectural committee.

This is difficult because the committee has no incentive to make such an
exemption.

2. Secure enough votes amoung the homeowners to remove the restriction.

Even more difficult since it's hard to convince the needed 2/3 or 3/4 of
the homeowners that it would be in their best interests to let you put
up what is, to them, an ugly eyesore.

I'm hoping for a court ruling that will declare the more restrictive
covenents (those that don't allow any antennas at all) an unconstitutional
violation of free speech.

People who are not initiated into the nature of radio find it inconceivable that >>ANYONE<< can tune into their cordless phones, et cetera. They seem to believe that there is some magical, invisible cable connecting the sets together and that it is just like a regular phone wire - only invisible!

How do you educate them - gently?

I have a question regarding call signs. If some people let their calls lapse after their license has expired, or some other situation occurs where a person's call sign is no longer valid (upgrades w/request for a new call sign?), where do those calls go?
Why does the FCC go "backwards" with calls when someone passes their exam for a higher level? Why not reuse (recycle) calls which were given but no longer in use (valid?)
Also, what happens when all possible calls for all classes are gone?
Will we be using new letters? Recycle old calls? Go into longer calls (Novice -> 3 x 4/4 x 3, Technician/General -> 2 x 3/3 x 2), etc.?
And finally, what ever happened to the "other way"? By 'other way', I am referring to the fact that the Technician license is generically known by the 1 x 3 format, Novice by the 2 x 3 format, etc. If the FCC is running out of these, what ever happened to the inverse -> Novice 3 x 2, Technician/General 3 x 1? Do we see many of these formats

around? No. (At least I haven't seen the 'inverse' format around too much.

Thanks.

Just wondering.

Check this out: 5WPM=25 characters per minute= one chare
character every 2.4 seconds. I figure that there is an average
three dits or dahs per character, ergo there is about one
dit or dah every 0.8 second. Boy, that's SLOW.

> >
> > This is just TOO much!
>
> Everyone who needs to call for emergency service has access to
> the E9-1-1 system, EXCEPT HAMS. This looks like a problem to me.

In a panic situation, you somehow forgot to tell the dispatcher your location and the dispatcher never asked for it. After a few minutes pass, you call back wondering where the emergency vehicles are. The dispatcher tells you that they are on location now and are unable to find where any problems are. You tell them that two vehicles are on fire now, and they tell you there are no other vehicles on the hill and no smoke to be seen anywhere. Eventually you figure out they are dispatched to where the phone line is installed, are the wrong jurisdiction, and the dispatcher is now sending out a response to the location you indicate. Someone could DIE 1 minute before arriving at the hospital.

Hams do have access, but it might not be properly identified, and that might cause problems in some (rare?) cases.

> > Problem: When dialing 9-1-1 from the repeater autopatch, the repeater

> properly trained.

What do you normally get to find out about a call?

What would you think would be best to see in place of (or in addition to) that information to properly tell you about a ham repeater/autopatch that has coverage over a wide (possibly multi-jurisdiction) are?

> > The solution is to eliminate the ALI (Automatic Location
> > Identification).
>
> Wrong. The solution is to IMPROVE the ALI.

I think Tad's "solution" was a reasonable TEMPORARY one to deal with the "mismanagement" that appears to exist in his jurisdiction. There being no ALI at all at least gets the dispatcher to ask for the needed information instead of assuming what the computer gives them is correct (read my case scenario above). Commentary ALI that describes to the dispatcher exactly what the situation with that phone line is will certainly be better.

> > Now Mr. Stark Raving Ham is PISSED OFF, because....well, no one's
> > really sure WHY he's upset...he just usually is.
>
> I have not engaged in any personal attacks, which is how
> "flaming" is defined. Care to describe the above comment?

Actually, "flaming" can include direct attacks on ideas as well. When
someone is (perceived to be) upset, their statements can also be
interpreted as an attack as well.

> > This guy actually sent me mail, saying he USED to think Seattle
> > was an OK place before he read rec.ham-radio and found out what

>
>   I would like to see a copy of this alleged mail. I sent no such
> message. Show me. Now.

That was one of the errors. I sent that mail to Tad, and he got it
confused. But he did catch it shortly thereafter, although I did not
get that one before I made another posting dealing with that. Some
of my mail was bording on the "flame" side, so that is probably much
of the source of confusion. Things are settling down on this issue
a little bit, so maybe we will soon come to a convergence of understanding.

>   Perhaps another issue has crept in here that obscures the
> original argument. Do you transmit "out-of-band" as a ham or as an
> authorized member of an agency with operating authority on those
> frequencies? (I am assuming that, as you state, the equipment itself
> is legal re certification.)

In my own case, I an trying to examine BOTH possibilities:

1. I could operate AS A HAM, on a public service frequency (violating
    97.301), using a non-type-accepted radio (irrelevant AS a ham),
    and invoke 97.403 to cover the violation of 97.301 for the type
    of emergency intended to be covered by 97.403 (whatever that is).

2. I could operate as a member of the public service agency I volunteer for, on a public service frequency not normally used by that agency, communicating with dispatchers that ARE familiar with that agency (we sometimes borrow a dispatcher for our storm spotting), but using my modified ham radio equipment that is NOT type-accepted and is NOT certified. This would be in violation of FCC rules I don't have copies of right here, but might also be exempted similar to 97.403.

The only case I am concerned with is a REAL EMERGENCY. There appear to be many hams and non-hams using non-type-accepted nor certified equipment in routine public service/safety roles. But that is an issue I am not now addressing, so I please don't get these things confused.

> If you transmit on frequencies allocated to another service as a member of that service, then Part 97 does not apply to your communications at all. You are then bound by the applicable regs for the service you are using and the general regs for all radio users. The fact that you also happen to be licensed under Part 97 as an individual is immaterial.

Agreed. That DID begin with an "If".

> In my *opinion* this is different from the case of a ham who takes his HT, which is only certificated for amateur use, and modifies it for out of band coverage for whatever reason. If he can get the radio certified/type accepted/whatever by the FCC for the additional frequency coverage, the radio itself is legal. Then all he needs is a license in the appropriate other radio service OR authorization from a licensee to transmit under their license. That takes him completely out of Part 97.

That is *IF* the ham is going to use the radio in that service.
This would apply just as well to a NON-ham who has ham equipment.

> Remember that this whole thing got started by somebody who stated he was trying to access non-ham repeaters with ham equipment and wanted advice on how to attain the odd split. Nothing in the message offered any evidence of type acceptance for his radio to go outside the ham bands, nor did he mention any authorization or licensure for non-ham transmission. If properly licensed outside of the amateur service, he could have simply contacted a service shop or the manufacturer for this info. Even if he simply preferred to ask fellow hams for advice, mentioning the above might have made life easier.

I contacted a service shop just to see, and they had no idea of what I was talking about. I guess I need to go read all the rules on that.

> The beginning of Part 97 (Basis and Purpose) mentions "self policing" as one of the traits of the amateur service. I don't think any of us take that to mean playing radio cop with each other. I do believe that it obligates us to at least try to keep each other out of trouble.

Just picking nits here, if the "ham" was going to be operating ILLEGALLY
in another service, it would NOT fall under Part 97 Basis and Purpose for
self policing. You could just turn him in to the FCC or you could just
forget it. On the other hand you may have done him a favor by telling him
that he might be setting himself up for legal problems.

Or, get one of those mag mount rubber ducks (I had always wondered why
in the world anyone would want a mag mount rubber duck, now I know!) :-)

> as to who may engage in auxiliary operation.

97.201 covers the rules on Auxiliary operation. In summary:

Frequencies allowed:	License classes required:
220.5-225 MHz	Technician
420-431 MHz	General
433-435 MHz	Advanced
438-450 MHz	Extra
all higher bands	

Automatic control is prohibited unless it is part of a repeater system that is under automatic control.

The same rule about interference between coordinated and non-coordinated stations applies as it does for repeaters.

One way transmissions are authorized.

Also from 97.213:

Remote control via radio requires use of an auxiliary station.

But I cannot find any rule that says that the auxiliary station has to be on a different band (than, I guess, whatever other stations it is connected to). Usually it is a TECHNICAL need to do this, but if you can overcome that need (e.g. a set of cavities) you could operate INBAND. But clearly you cannot be INBAND on 2 meters since you cannot operate the auxiliary station there at all. But I see no problem with doing it on 220 or 420.

Well, I've been kicked into starting the un-net once again.
My 10m rig is currently on mothballs :-), but thats no reason for
EVERYONE to stop un-netting. So, everyone, lets see some 10m activity
on Saturdays at 1700 UCT through 1900 UCT. Check on or around 28.390MHz
and 28.410 MHz, USB. (USB? LSB? Shucks, I forget! Boy, has it really
been THAT long? Use whatever is standard for that band...)

If 1700 through 1900 is very bad (or if you just prefer a different time),
email me and I'll start a 'real vote' on the issue (whatever "real vote"
means :-).

So, grab your 10m rig and talk to your usenet friends!

I saved this from the net a while ago:

Albert Einstein, when asked to describe radio, replied: "You see, wire telegraph is a kind of a very, very long cat. You pull his tail in New York and his head is meowing in Los Angeles. Do you understand this? And radio operates exactly the same way: you send signals here, they receive them there. The only difference is that there is no cat."

Why? The average layman doesn't know beans about the technology of HOW those things work. The "expectation of privacy" concept of someone whose only knowlege of radio is that it's like TV only without pictures is totally different from a ham's or an engineer's. I once tried explaining to a friend that her baby monitor could be heard as much as 1/4 mile away. She refused to believe me ("because I've got the other half of the pair").

> IMHO if "their" transmissions are in "my" air then they are "mine".

Aside from the question of whether it's "your" air exclusively, there's the question of whether the information content ownership is a separate issue from the possession of the signal by which it is transmitted. So far, the courts have agreed that it is.

I think swls are going to have to get used to the idea that as radio use for such applications increases, the pressure to guarantee privacy is going to increase.

Moreover, there is the fundamental issue: why would any decent person WANT to eavesdrop on the private lives of others?

Considering that Congress created the FCC to act in its behalf, I'd say, YES.

There will no doubt be a contention that transmitting certain types of radio signals (such as baby monitors and cordless telephones) ENLARGES the personal space. I grant the right to determine if an RF signal entering my space harms me in some way. I doubt that that requires that I inspect the information contents of that RF signal.

> Think about it ... If monitoring cordless phones is illegal, then what

No, only the information.

> receivers
> are censorship, plain and simple.

Strange, but the U.S. is one of the very few places where people feel this way. In most other countries, including very democratic countries, the attitude is that the public only has the right to listen to radio transmissions that are the public's business. Listening to "private" radio transmissions is forbidden. ("That's rude, old boy!")

If you are speaking of 'phone patches, yes, it must originate there. If you mean can you send a MARSgram, the answer depends on whether the APO/FPO zip is on the approved list. This is not automatic for all APO/FPO numbers everywhere. It depends on whether there is a MARS station for that immediate area.

Recreation contacts (other than overseas morale 'phone patches) are never authorized.

>
> That is only my opinion, however. I am not a communications lawyer or FCC investigator. It might be an interesting question to pose to someone who is.

In my case I'm not talking about being in a "routine" situation, such as your firefighter example. I am concerned about the SUDDEN EMERGENCY situation where SECONDS might even determine if someone dies. I'd rather arguing my case in front of an FCC judicial administrator rather than going through a few years of psychological counselling because I let someone die because I looked for a phone instead of using a radio I have.

Secondly, I would NOT pose the question for any sort of "official" answer outside of an actual case because there are too many possibilities. This is ONE of the reasons many laws are intentionally written vague. If you ask an FCC investigator or staff lawyer, they could very well say "no" when, if they were your judge, they would say "not-guilty", just because of the nature of their functional role in the FCC. Do not pose the question to them. If you want a legal analysis of it, your laywer or a communications attorney would be the proper people to see.

Agencies certainly don't want others on their frequency, mostly because there are people who, mostly from lack of training, would interfere with their operation. Unfortunately there are a lot of people out there who would be what these agencies fear, and these people have ham tickets, too.

Well, I've gone and done it. I ordered the FCC Ham radio master database, to be current as of 10-19-90 (thats Friday, as in the day after I posted this). I hope it will arrive sometime before the end of November.

Those of you who know what this is, the queue will be FIFO, so the first tapes will go out first. As I mentioned, our cost went up a bit, and I may have some trouble with cartridges, but the race is on. (For those of you who don't know wht this is, and would like to know, email and I'll explain.) Notice that the NTIS did us over again, so our cost went up to $25 each. Sorry about that.

Oh, yes - my address changed. It is now either

Rusty Carruth @ P.O. Box 27001, Tempe AZ 85285 (just like my .sig says!)
   or
Rusty Carruth @ 245 W. 10th Place #6, Mesa AZ 85201.

The advantage of using the p.o box is its safer. The advantage of using my home address is its a bit faster, but they will probably leave the media outside, so safety will be lower. It is your media, you choose.

Any questions, email or call. (602) 953-4456 daytime, 898-9274 eves (but please, after 6pm and before 9pm MST (NOT Daylight savings time!))

There are two difference between wireless lans and ham packet radio:

1. We cannot encrypt.

2. We can use more power.

I would be very surprised if the insulation has any effect at all. Treat
it the same as bare wire for resonant length purposes.

>According to my ex-lawyer, who wrote and enforced deed restrictions, there is another way to break them: abandonment. If you violate the restriction, and after a "reasonable" time no-one challenges you on it, the court MAY hold that they abandoned the contract by failing to enforce it.

This is true. I've had my HF6VX up for two years now. Nobody complained. [BTW, the ground-mounted vertical is probably the most discreet antenna around - I put mine next to the house, and it disappeared.]

As a practical matter, the enforcement of CCRs is usually turned over to a homeowner's association. Unless they have an extremely vigorous enforcement gestapo, contract abandonment is very likely. The only other people that could report you to the gestapo (the neighbors) probably don't even remember all the fine print on the CCR document and the other flurry of documents they signed when their house closed.

>The problem is that both of these routes are expensive, risky and can lead to neighbor problems (which is bad new for everyone). We had a ham here in AZ who spent $22,000 fighting deed restrictions that had prohibitted him from putting up a dipole, and he lost the case.

The other practical aspect of homeowner's assn enforcement is that most of them are flat-broke. The legal strategy is to get your lawyer to file expensive and time-consuming motions until their money runs out.

>I am not a lawyer. These are just my opinions. Your mileage may vary.

I'm not a lawyer, either. These are just some personal observations from another ham stuck under a CCR.

I wonder now if, because the antenna clause was abandoned on my CCR on enforcing the HF6VX on the ground, I can now put up a "real" antenna on top of the roof. (heh, heh, heh.)

>them on the air. Throw your microphone in the trash. You can replace it later
>with a good one when you need it.

>When you finally do get that new D-104 crystal mic

Sorry, Richard, I got the D-104 first, then borrowed an iambic keyer. I'm not about to throw away perfection. What you say is true, though - the CW bands are much more orderly. When they aren't orderly, the 100 Hz filter takes care of the riff-raff. Maybe that's it - nobody behaves rudely because it is so easy to tune them out.

Anyway, nice article. Engage your systems' flame filters, because the no-coders haven't figured out that CW can be fun/challenging/relaxing - in short, the reason why you become a ham in the first place.

I have full access to the equipment at my University's club, but was still wondering if there was any type of decent indoor antenna for HF use?
>
>Thanks.
>
>Scott

I've had some luck with a horizontal loop in situations requiring a small antenna. You'd just tape the wire along the top of the walls in your largest room. Connect it to a tuner via cheap twinlead you buy at a hardware store. Don't worry about dimensions, just get as much wire up as you can. Let the tuner worry about SWR.

Apartments are a problem, though, because you're so close to someone else's TV. Even if you don't transmit any harmonics, you'll probably overload the TV's front end. 10 meters is especially bad, because its 2nd is on channel 2, and it's 3rd harmonic is channel 6.

Maybe a lower-power rig would help. G'luk. I think, in the end, you'll have better success with the club station.

Perry

This is a recording.... *beep*

Perry/KF0CA

From: brianr@hprnd.HP.COM (Brian Ripley)
Subject: TV twin-lead J-pole Antenna
Organization: HP Roseville Networks Division

The following is a description of a J-Pole antenna made from 300 ohm TV twin-lead. Quite a few of the hams in the area have successfully built one or more of these antennas. They have quite a few advantages which include improved performance for 2-meter HTs, portability, and last, but never least, they are inexpensive.

```
                    |   | do not short this end.
                    |   |
                    |   |
                    |   |
                    |   |
                    |   |
                54" |   |
                    |   |
                    |   |
                    |   |
                    |     1/4" gap
                    |   |
                    |   |
                    |   | 16 3/4"
     coax shield ==>*   *<== coax center conductor
                    |   |
             1 1/4" |   |
                    -*-
          solder the twin leads together at bottom
```

1. Start with 54 1/2" of TV twin lead (foam core does not work as well)
2. Strip 1/2" of insulation at bottom and solder wires together.
3. Measure 1 1/4" from soldered wires and strip insulation on both sides. This is the solder point for a coax feedline.
4. Measure 16 3/4" from bottom and cut out 1/4" notch on one side.
5. Feed with a length of RG58U coax. Tape coax at feedpoint to the twin lead for strength and weather protection.

I have also attached an aligator clip to the plastic on the top of the antenna in order to conveniently hang it. I am successfully using one in my attic to avoid any CCNR problems. I have another that I can take with me camping, sailing, etc.

This design has appeared on many BBSs and in club newsletters; the earliest reference that I know of is a Jan. 1984 D.A.R.C. antenna article by James Burks, KA5QYV.

Enjoy,
N6UBM

From: "Geoffrey_C._Williams.WBST207V"@XEROX.COM
Subject: Re: TV twin-lead J-pole Antenna
Organization: The Internet

I have made and used these 300 twin lead antennas for over ten years. Another good way to mount them is after assembly, as described by brianr@ucbvax.Berkeley.EDU (Brian Ripley). slide the whole thing inside a length of 1/2 inch dia pvc tube put on an end cap, seal up the bottom and you have a permanent cheap J pole. I have one on my roof thats been there 7 years through almost 8 Rochester NY winters, so do'nt think they are not rugged.
If you wish to get a real good match another trick is to solder a pin to the end of the coax center and shield, then probe through the insulation to find the best match. Having found the best point then you can remove the insulation and make the final solder joint.

Enjoy   - Geoff Williams G4JJO

From: perry@hpfcdc.HP.COM (Perry Scott)
Subject: TV twin-lead J-pole Antenna
Organization: HP Ft. Collins

Some comments on construction:

1. To tune for 146.000, 1/4" was pruned off the J, and 3/4" off the radiator. The top of the J is 3/4 wavelength, while the stub is 1/4. Prune in a 3:1 ratio.

2. Tuning. The length of the radiators affect resonant frequency,

while the feedpoint position affects feedpoint resistance. To change resonant frequency, prune. To lower the entire curve, probe.

3. For mechanical strength, I used tie-wrap to (loosely) tie the RG8X coax to the lower end of the J while probing & pruning. This causes RF to couple into the shield, so wind the coax into 3 turns at ~1" o.d. just below the tie-wrap. Wrap with electrical tape.

4. Use the stickpins as described by G4JJ0. I just left them in place after probing and pruning for minimum SWR, and soldered everything together.

5. Cinch up the tie-wrap as tight as you can, then wrap the lower end of the J in electrical tape to keep water out. You may also want to wrap the other exposed areas with tape if the J is going outside.

6. For portable operation, I cut a small hole at the top for hanging. A bit of monofilament allows the antenna to be hung almost anywhere.

Enjoy,
Perry Scott/KF0CA

Yes I agree the Toko helical filters have 7 or 8dB loss; but IMHO this is better than an attenuator; an attenuator takes the wanted AND unwanted signals down by 10 or 20dB (or whatever). The filter takes the wanted signal down by 7dB but takes the rest of the garbage down a good deal more.
And yes, you *CAN* transmit through them as long as you keep it below 5 watts.
An RF-sensing circuit and double-pole changeover relay to take the filter out on transmit would be the *nice* way of doing it.
But *WHY* should we have to do this when the filter should be *DESIGNED* into the radio from the beginning. Come on Icom, Kenwood, Yaesu, Standard build radios that are usable. Would Ford or General Motors or Toyota get away with selling automobiles that stopped working when you got 50 of them side by side??

JUst bought this fantastic radio. Any know a mod or key sequence to enable
extended frequency coverage for this radio? The duplex and ease of operation
for this radio is great. Thanks.

I'm looking for subscription info for commericial HF and VHF magazines that
are similar in content to 'Microwaves and RF' and the other shf frequency mags.
We've got boatloads of shf mags around here, but alas, no subs to 'real radio'
type magazines.

I promise only to read it 'for the editorials'!!!

I have a very big favor to ask. Soon, I am going to be looking for a workable HT (preferably dual-band and with DTMF capabilities). What can anyone tell me about the different manufacturers and their models? And prices?

Here is a list of manufacturers that I have sees ads from. If there is anyone that I missed, please add them to the list.

Please include any information you think would be helpful in my purchase. The key factors I am looking for are: Quality, features, and reliability versus price. (But then again, who isn't?) One important note though: I am very tight on money. I would like to hit Ham flea markets & discount warehouses (<- Do they exist?) first.

List:

Heathkit
Alinco
Kenwood
Motorola? <- Do they make Ham HTs or just commercial two-way tranceivers?
ICOM
Yaesu

Thank you very much in advance.

Modifications to the Alinco DR-110 2m mobile:

After installing the out-of-band receive mod on my Alinco 110, I accidentally pressed a couple of keys and found I could receive from:

130 -> 170 MHz + Xmit of this range
340 -> 380 MHz - no Xmit
870 -> 890 MHz - no Xmit

To modify the Alinco to receive out of band, perform the following steps:

Remove the top cover by removing the obvious screws. Be careful, as the speaker may stick to the cushion on the top cover. If it does, separate the speaker from the top panel and replace it back in its receptacle within the rig.

Positioned at the front of the rig, look near the tuning knob and you will see a little yellow jumper coming from behind the front panel, looping around and returning to the front panel. This jumper looks like it should have a tag on it saying 'cut me for more features'. Go ahead and take the wire cutters to this jumper.

Replace the top cover on the rig, get everything set back up and turn on the rig.

The next step is to reset the radio. If you don't remember its current programming, you may want to write it down at this time.

When ready to reset the rig, hold down the F key and the VFO/M key at the same time, turn the POWER off, back on, and then let go of the keys. The rig is reset and will display 144.00.

You will now be able to tune around, and transmit, from 130.00 -> 169.99 MHz.

To move to the next 'band segment', press F and then the MHZ key. The display will go the 340.00 MHz segment. F+MHZ again will get you cellular, and F+MHZ a third time will return you to the 2 meter segment. Happy monitoring...

OK, maybe you could receive through a filter with 8 db loss, but I would really rather not transmit through one if I am running on batteries with only a couple of watts.

I don't know offhand what the Q is on the Toko filter, but if you need to make it a bandpass then you need at least 2. If you have a dualband HT, then you need 2 sets. They may be small, but 4 or 6 of them gets to be pretty substantial compared to the radio itself.

On the other hand, it might be reasonable to incorporate some lower loss (bigger) filters into the mobile or home antenna installation that you use with the HT. The amps a lot of people use already have T/R switching.

I am told that there is a mod. to the ICOM ICR1 that improves its overload capability; apparently in all modes, the 'first IF' filter is the same... its always the one used for Wideband (i.e. broadcast-band) FM. So the second mixer etc. is several hundred KHz wide open to nasties.
The mod. consists of narrower 'roofing' filters being switched in on non wideband operation.

There are also rumours of a mod. that gives SSB reception on the IC-R100 (Yow!) more news as it comes!

Depend on what you call "active". There is certainly a lot of 440 activity in the New England area. Although with the advent of more abundant 440 equipment in the past several years is changing the flavor a bit, the style of activity is usually different. Used to be the type of people on 440 were the frontier people and the ones trying to escape from the "channel 19" flavor of a lot of 2m operations.

In the NE area there is also World Net. This is primarily a network of about 8 full time linked 440 repeaters, with one 220, two 6 meter and one 10 meter repeater. Although it is a "members only" network it is not a closed system, and visitors are welcome and encouraged. Regular users are asked to join in one of several ways. This can be a small fee or donation of equipment or time, participation in a network sponsered public service events or just regularly checking in to the once a month emergency net.

Anyone interested in a free newsletter can send a business sized SASE to myself, N1DXG, or N1EXQ at our callbook addresses. Optionally I will be looking into providing a postscript version for email. I am not sure how big the file is yet to see if it is worth it.

I have a version of "go" about 3/4 of the way written ... it is all written in C using Borland's Turbo-C (it will compile with version 1.5 or 2.0), and it talks to the TNC using the ROM BIOS async routines, with the TNC in KISS mode.

The graphical interface and level three stuff is all written; I need to finish the level 2 stuff, and see if I can't figure out a way to better handle synchronization problems.

What I'd *REALLY* like to do is to make a chess version, but I don't know enough about the game to make it work. As soon as this go thing is done, I will post it in source form to rec.ham-radio.packet and invite a chess expert to help.

Does anybody have any thoughts that might help me with this project?

> This brings me to the deeper question. WHY DO WE NEED ALL THAT MICROWAVE
> BANDWIDTH??

Bob,
  We need it because the microwave bands are the only place where we have both adequate spectrum and the possibility of fairly well focussed beams to efficiently transport large amounts of information by radio.
  Below 1 GHz or so there is neither the spectrum nor the directivity with reasonably sized antennas.
  Ultimately we need the bandwidth because we need to transport a *lot*

of information (not just TV) if amateur radio is going to survive in
the information age by being relevant to information age services.

  I've just given a rough abstract to my paper in the recent ARRL/CRRL
networking conference proceedings. Please see it for details.

What ever happened to the Gateway Newsletter? It used to be seen along
with the Info-Hams Digests and then disappered. I have just recently
joined the Packet ranks and am very interested in getting it again. If we
can't getit through the internet can it be found on packet BBSs?
Thanks for the help and 73.

I have it in mind to buy myself a new toy soon, specifically an
"Oscar" antenna package.   You know the kind of thing, 2m. and 70cm.
beam yagis of >10dB gain and circular polarization.
So could anyone post their views on commercial offerings, particularly
performance experience and perceived quality of construction.
I am aware of the offerings of Cushcraft, HyGain and KLM. Any others?
How important is a remote control left/right handed polarization switch,
and which packages include this?
Any views on the practicality of using an Alliance 110 rotor for
elevation? (I have a heavy duty rotator already for azimuth).
Thanks in advance, I suggest posting responses if of likely wide
interest.

]
]Or at least have your lawyer read them and decide what you can and cannot
]do with them.

According to my ex-lawyer, who wrote and enforced deed restrictions,
there is another way to break them: abandonment. If you violate the
restriction, and after a "reasonable" time no-one challenges you on
it, the court MAY hold that they abandoned the contract by failing
to enforce it. Depending on the state it may invalidate the entire
set of deed restrictions, or it may invalidate it for just the clause

involved.

They can also be broken if they are discriminatory. Thus, if they prohibit antennas, but they have been allowing TV antennas for a long time, you can require them to either ban all the TV antennas, or grant your antenna. Of course, the TV antenna owners can use the abandonment argument to keep theirs, so again you win.

The problem is that both of these routes are expensive, risky and can lead to neighbor problems (which is bad new for everyone). We had a ham here in AZ who spent $22,000 fighting deed restrictions that had prohibitted him from putting up a dipole, and he lost the case.

I am not a lawyer. These are just my opinions. Your mileage may vary.

]away with selling automobiles that stopped working when you got 50 of
]them side by side??

Well... Icom, Kenwood, Yaesu etc seem to be doing just fine without them. I've noticed that most hams look at sensitivity specs, and wouldn't even know how to read an intermod/blocking spec - that's probably why we see extremely sensitive HT's. Furthermore, you really do want high sensitivity for portable operation when you are away from all the RF sources. I would guess that MOST HT operation is away from these sources. For this reason, I suggest a switchable attenuator (MUCH cheaper) for operation around high RF sources, and that can be switched out when not needed. I think an HT with this feature would handle almost all cases. For those few cases where it wouldn't work (need to hear weak signal while near strong sources), I would suggest that the user use something external.

If you look at repeater sites, they use LARGE, EXPENSIVE cavities to achieve what you want: minimal sensitivity to other signals. In the repeaters we use (modified Motorola), there is a stiff front end and helical resonators. All of this stuff is still not enough to prevent desense and intermod.

RF inter-operability is not an easy problem. Expecting manufacturers to solve it in tiny HT's is just unrealistic.

>I calculate some AVERAGE channel capacities needed by 2 to 1000 hams doing
>a lot of large file transfers.

>Regarding occupied bandwidth, Fred says:
> > Okay, you've gone WAY wrong.

First off, Bob, you've missed the dictional reference. You asked, after
explaining why we need so _little_ bandwidth, if you had gone WAY wrong.
I simply replied in kind, trying to prove that we do need more b/w.

>I say: .. and have a good S/N ratio... HEY FRED, I was trying to say we
>NEED the bandwidth, not that we need even less.

Then why do you average over a long time? That causes the bandwidth
requirement to go down, not up. My posting is to demonstrate why
we need more b/w than you implied we need.

> > Second, what is the latency we're tolerating? We do a lot more than

> > bps, it's hopeless.
>I say: Don't you have computing power locally?   Can't you transfer the mail
>in bulk and read the individual messages locally? ...

No, you can't, unless you recalculate the News paradigm. The News server I'm reading you on gets over 1100 newsgroups. I read a few hundred messages a day, out of tens of thousands. In some groups, I only scan the titles and pick out the interesting ones. With the "local computer" paradigm you mention, every user would need a news server, or would wait. And to be a server, you'd have to pump up the volume of messages.

That's not a "mainframe does everything" attitude, it's an efficient model of distributed processing.

>I then talked about how much bandwidth TV (raw analog or 1 Mbit/s compressed)
>takes, the idea being to show that TV is a bandwidth hog (either way) which
>is what is NEEDED to actually fill up the bands. Regarding compression,
>Fred says:
> > That's not exactly true either. If you're talking about

> > a little jerky. (That's hardly an ATV price range.) But "full motion"
>I say: Why do hams need more that "talking heads" ;-(Also, today's price
>won't protect bands tomorrow.

Which side are you on? I'm arguing for hams to have the b/w. You implied that network quality video could be done in 1 Mbps, and that's not true. Talking heads is fine for hams, but compression is currently too expensive. I agree that hams tomorrow could have it. We may need it.

>I say: ABC news has been using compression to
>get two TV pictures into 45 Mbit/s (T3) between NYC and DC for a number of
>years. Do you complain about their picture quality?

When's the last time you watched a horse cavalry scene on the news? Half of a T3 is 22 times more than 1 Mbps. That's barely compressed.

If we really were concerned about our bandwidth, we'd abolish 1200 bps AFSK packet.

Re: News programs & scanner enthusiasts

May I suggest that when folks write to CBS (or whoever) that they kindly mention that major news stations use (evil, assault,baby-killing) scanners to find out when and where they should dispatch their news crews.

When scanners are outlawed, the news divisions of major networks will become outlaws! (unless they buy exemptions.....)

Some rule changes happened back in the seventies that made it possible to request calls if you didn't have 25 years. On July 1, 1977 (??) the FCC opened special call requests to any Extra. At the time, there were only 70 or so 1x2 calls left in CA. I was lucky enough to get my code speed to 20wpm and pass the Extra around 7/1/77 and I got me (oops-that's "my") third choice of call (I submitted a list of 20 calls just in case). Seems to me some friends did the same thing and got some of the 2x2 calls (AA6EE comes to mind) way before the FCC started giving those calls. Sometime after that, they changed the rules again, and you just had to take what they gave you.

Here is my reply to a number of comments on DAB taking ham microwave freqs.

I said:

>> code license, I
>> conclude that the only ham application likely to NEED all our microwave
>> bandwidth is the transmission of TV images.

David Stark replies:

> It does seem to be the logical candidate among the KNOWN modes.
> Or how about spread spectrum? Are there any calculations available on
> how many hams using spread spectrum technology could occupy xxx MHz?

My answer:
As a rough estimate, I hear that you can get almost as many spread spectrum (SS) stations into a band as you can using narrower-band modes (like FM or FSK) sending the same info. There may be some capture-effect problems, however. The idea of far-out sidebands from SS really frightens the weak-signal crowd.

>>>>>>>>>>>>>>>>>

Kevin J. Rowett says:

> Seriously Bob, your statements seem very politically motivated than based
> in reasons...the impression I get about your basis for spectrum
> management is NIMBY...Not In my back yard! You'd like AR to support
> your interests in weak signal work. At the same time, your willing
> to sacrifice our usage of spectrum to keep yours.
>
> Just waht does the weak signal work contribute to the hobby that makes
> it deserve more than other sections of the hobby?

I reply:
Kevin, I think you DID read me wrong. I suspect that a very few MHz of most microwave bands CAN be preserved without much effort. That would be enough for the weak-signal (and probably the digital) crowd. We need to have a clear reason to keep the rest.

>>>>>>>>>>>>>>>>

Gary Coffman points out:

> The numbers in your article didn't allow any guard band. Assuming reasonably
> state of the art equipment, doubling your numbers should allow acceptable
> guard band.

I say:
You're right. But my other numbers are certainly in error by at least as much!

Gary goes on:

> Considering your 35 kbs assumption, I certainly want better thruput than
> that. Floppy speed of 500 kbs would be acceptable now, but I do want to
> be able to interact with a X client/server pair in a snappy manner.

I say:
You're talking about burst speeds here, not average rates. Does your floppy transfer data more than 7 to 10% of the time? Not in any well-designed application. I'm talking about an average of 35 kbit/s of a 1 Mbit/s (burst-rate) channel. You're not convincing me yet. Same agrumemt re: X-windows.

Gary goes on:
> I do want to be able to program distributed computer systems. I do want to
> transmit high definition video in real time. I want to do things that
> are currently impractical because we don't have the speed/bandwidth
> needed yet. Predicating future spectrum needs on current digital usage
> is a mistake. There are many potential digital uses that currently aren't
> being done because the technology to give us the needed thruput isn't
> available to amateurs yet.

I say:
Now you are getting into some stronger arguments. We both agree that video is a clear user of wide bands. We've had these microwave bands for many decades. How can we say we don't have the speed/bandwidth yet? Your "don't have" means "can't BUY cheaply". Distributed computer systems don't seem like a mainstream activity, at least I wouldn't expect hundreds of nodes to be simultaneously active. Today it's worthy of a journal article when someone teams a number of SUNs on a single job with DOE or DARPA funding, isn't it?

Gary goes on:
> As one example consider an autonomous mobile robot.

I say: Autonomous means not connected to the outside world = no communication.

Gary goes on:
> It transmits high
> definition video of it's surroundings. It's movements are controlled
> by a set of cooperating subprograms running on a group of desktop
> computers all connected by a distributed network. Sounds fantastic
> doesn't it? Give me the thruput and I know several people who would
> like to take a crack at it.

I say: We've had the bandwidth for decades......where are the people?
This sounds like a worthwhile and interesting one-off FRINGE activity.
People like Chip Weems in the DARPA image-understanding community talk about special SIMD machines for the earlier steps of image processing, not at all like PCs. Except for the TV, about 30 updates a second is MUCH more than enough and takes very little communication bandwidth. Terrain-following aircraft control systems operate on a 30-updates-a-second cycle, at supersonic speeds....

Gary goes on:
> The lower microwave bands are ideal for
> this application since conventional omni antennas are still practical.
> At 10Ghz and above tracking problems would become severe at fairly
> short ranges.

I say: Agreed, though I think people like CMU are using 70 cm, or so, for their robot vehicles.

Gary goes on to mention radar, etc., and then says:
> There's lots more than weak signal work being done at microwave frequencies.

> Not a lot of people are doing it yet, but as more people learn how to
> do it, the activity will hopefully grow. If we lose large chunks of
> spectrum, it'll die on the vine. The few remaining slivers will only
> be useful to the weak signal DXers and some great experimental work
> will be lost.
I say: That's why I want to save WIDE bands, but we need good arguments to
win. "Going to use", "should use", "will need", "will grow" won't be enough.

It disappeared about the same time that it got incorporated into QEX. My guess
is that whomever edited Gateway had usenet access and posted it gratis.
Whomever edits QEX/Gateway doesn't have usenet access or doesn't think it's a
good idea (in these times of ham periodicals folding up) to give away the goods.
You can subscribe to QEX/Gateway through the ARRL. (You don't have to be a
member, but it costs more if you're not.)

Yes, there is an extended frequency mod for the IC-3220. I don't have it with me and will have to find it first.

It will be hard for any of us in the US (or anyone in North America for
that fact) to help too much since Icom is not importing these radios
into this market. Uniden has either sued (or has threatened a suit)
against Icom for scanning patent infringments, and the radios are
in limbo at this time.

(I'd like to thank Uniden for this by boycotting their lousy sccanners
but I would think Icom would figure a way to get their radios into
the market.)

Where did you buy your R100?

Yep ....

The league maintains a full time lobbyist, and a PR firm in the Washington area whoose main function is to lobby congress and keep issues related to the hobby in front of congress. They also have a full-time legal type to deal with matters before the FCC. Fact is that they are spending a great deal of time and effort to prepare for the next World Administrative Radio Conference which where a number of issues relating to the future of ham radio will be decided.

>I say:
>You're talking about burst speeds here, not average rates. Does your floppy transfer data more than 7 to 10% of the time? Not in any well-designed application. I'm talking about an average of 35 kbit/s of a 1 Mbit/s (burst-rate) channel. You're not convincing me yet. Same agrumemt re: X-windows.

How can you say that a well designed application "should" be compute bound rather than i/o bound when you don't know what the application is?

Someone said (not sure if it was you) that the computer should plan ahead and pre-fetch mail messages etc so a crummy response time wouldn't impinge

on the user. The ultimate extention of that is to just mail a box of tapes
to the other node daily and skip the microwaves altogether. Lots of data,
long response time. same deal.

Even ethernet at ~10 megabits/sec gets sluggish with a few too many nodes.

>Now you are getting into some stronger arguments. We both agree that video is
>a clear user of wide bands. We've had these microwave bands for many decades.
>How can we say we don't have the speed/bandwidth yet? Your "don't have" means
>"can't BUY cheaply".

This is supposed to be AMATEUR activity. Cost is a legitimate object.
This is another area where time = 1/money.

That's known as evolving technology. ATV is a lot more popular now because
cameras are cheap enough that a lot of people can afford them. ATV on
microwaves will get more popular as the equipment gets cheaper.. as will
microwave in general.

No, but in context of the discussion it is immaterial. Several people leapt to this person's defense on the grounds that transmissions by ham operators on non-ham frequencies was somehow OK "under the right circumstances." Circumstances to be decided by the individual ham, presumably.

I'm still waiting for the original requestor to explain what "non-ham repeater" (his words) he was trying to work with amateur equipment, and why.

> 2. Last time I checked, there was no regulation about not using
> strange splits for oddball use in the ham bands. Please post chapter and
> verse if there is.

Also irrelevant. The original requestor specifically said that he was trying to access non-ham repeaters.

> 3. I don't think hams need out-of-band capability. However, being a

Aye, there's the rub, those last 5 words. The out-of-band transmissions, no matter how well-intentioned, are still illegal.

> 4. There is one real good reason to use modified ham gear when

So far, the FCC has not offered to waive Part 2 (type acceptance) to save money for volunteer agencies or taxpayers. This is an excuse, not a reason.

> illegal to own a radio capable of transmitting at the local police
> frequency. It is not even illegal for a non-ham to own ham transmitters.

It is not unreasonable to interpret ownership as intent to use. If you can't use it, why go to all the trouble/expense of owning it in the first place?

I don't really care what the next ham does with his equipment, or who supports the manufacturers with their purchasing dollars. I do care that some jerk is going to modify his HT "because there are no rules saying I can't" and abuse the privilege to the detriment of the rest of us hams. "Ham operators" are accused by the press of causing all sorts of havoc, from interfering with airplanes (when an illegal CBer was the culprit) to wrecking TV reception to illegally eavesdropping on cellular phone calls (everyone with a radio must be a ham). Why invite such bad press by actually possessing equipment capable of illegal operation?

You may have a better bergaining position now that it's a buyers market. However, some housing tracts (and most condo tracts) have CC&Rs that spell out specific antenna limitations. The seller of the home will have no choice if this is the case. In Santa Clara County, no housing tract built since 1971 is WITHOUT a CC&R that prohibits some forms of antennas.

I am attempting to assemble an accurate historical account of the Student Information Net of about 1969-1971, its role at Kent State, and related coordination of campus protest regarding the U.S. involvement in Vietnam. Bits and pieces I have gotten so far have been interesting, but incomplete and sometimes contradictory. It seems that the legend aspects of this net have overshadowed its reality. Here is a sampling of what I have so far:

1. Brief, second-hand accounts from WA3VZW about coordination of protests at the University of Maryland including human blockades of U.S. Route 1 along the campus and something called "The Big Flush" which was (I'm not making this up!) a simultaneous flushing of campus toilets to overload the plumbing. This information, plus QSL cards from the UMARA archives, suggest that the SIN took the form of a 40-meter voice net with Cal-Berkeley serving as net control.

2. Brief anecdotal information from Cliff Stoll, K7TA about ham-operators on the Kent State campus being the only source of information out of the school as the protests and confrontation with the National Guard were

happening. Most of the information was relayed on an HF band via Morse Code, according to Cliff.

This endeavor will be the subject of an academic paper, and possibly a later publication in some form. My goal is a serious, objective, and tasteful account of the Student Information Net with due respect to all players involved. Amateur Radio gets a notoriously short-shrift in the so-called "Establishment" media to begin with, and the SIN is even more obscure. Getting the facts down and documented will go a long way towards preserving the memory of those student activists involved, including the ones that died at Kent State.

Since my objective is to be factual, I am interested in first-hand accounts, references, and documentation much more than hearsay or secondhand information. Information about any other sources like college ham club archives or student newspapers would also be helpful. My access to Internet is quite limited (A friend of mine posted this to Usenet for me) so I would much prefer that you write me via U.S. mail. My results will be passed along the net in a yet-to-be-determined form.

Please give this message the widest dissemination possible, on Internet, amateur radio/packet, mail, and word-of-mouth. Thank you.....

I have had some success using a helicaly wound vertical dipole on 15 meter CW <NO FLAMES PLEASE I work cw because fone annoys my XYL>. Worked FL, OH, NY, CA WA and OR yesterday. The antenna is made by wrapping two 3.5 ft. fiberglass whips with small magnet wire with about 3/16 in. spacing.

The helixes are in opposite directions (I don't know if this makes any difference). It resonates about 21 Mhz. Use a grid dip meter and trim or add wire as needed to make it resonate. If you can't borrow a grid dip meter try about 10% more wire than is called for in the quarter wave formula. The antenna should be adjusted in place because the resonance will vary considerably with the location of the antenna. I fed the antenna direct with 50 ohm coax and a tuner.

If I were making another I would use 1/2 inch PVC pipe with a coupling in the center for portability and convenience. I didn't worry too much about spacing I just tried to keep it even. Conventional wisdom dictates that the coax should come off at right angles but the antenna doesn't seem to care. The rig is not grounded and it is not hot with 20 watts out of a Yeasu FT7. I can watch a cable TV that is 8 ft. from the antenna.

This is the first indoor antenna I have had that I consistently get as good a signal report as I hear.

```

This message is mostly on behalf of a friend, but I am interested in this also:

I'm looking for documentation of all types of commercial equipment relating to comercial broadcasting. Things of particular interests are manuals and diagrams, etc of Commercial FM Circular Polorized broadcast anntennas. Needless to saw, Jampro wasn't too keen ofn the idea of sending us detailed diagrams. We just want to do some experiments with circular polarization, and can't dish out the $40,000 for a basic C.P. Antenna.

Also, We have guts and parts (he's a collector of such stuff) of all types of transmitters and exciters, and I was asked to see if anyone may have information on (older) commercial transmitters and exciters. In particular, we're looking for documentation for CCA 10 Watt direct FM exciter, which the manual was lost a few years back, and CCA is now out of business.
I belive the CCA is from the 60s to mid 70s, and will run 80Mhz to 174Mhz with the proper tweeks and mods, and was intended for commercial broadcast as well as use for "Fixed" use, such as in a Local Gov't VHF system, and is crystal controlled. (That bandwith requires component changes...)

Also interested in Collins tranmitters, other CCA equipment, millitary, GE, etc...etc....

Just for info, Fair Radio sales in Lima, Ohio in their Fall 1990 catalog are advertising rhis:

```
       Technical Materials Corperation's GPT-10K
       2-32 Mhz SSB  10 Kw (!!) transmitter
       "Appears complete except 4cx5000a PA and 8295A Drivers"
       2700 Lbs Shipping Weight         $4,000   (Not Bad...)
```

It might just cost another $4,000 to ship it!

I must be missing something. David expresses outrage that the League
didn't check with him personally when the board voted to hire a couple
of staff people. Then somehow this is construed to mean that there
is no representation, when in fact we elected the board.

Evidently, the theives in Boston have gotten wise to LoJack -- they tend to let stolen cars sit in an out of the way location for a few days prior to taking them off to the chop shops, nowadays.

Nada. Zip. PRB-1 doesn't say squat about restrictive covenants. Antennas are generally prohibited in subdivisions platted within the last 20 years. (And the places that did allow antennas were in unsuitable neighborhoods for other reasons, such as houses being too old, bad location, etc.). I am not willing to buy 5 acres of rural land just to put up a vertical or 2 and some wire antennas (which was the alternative available). There isn't a whole lot of land that isn't restricted in this way anymore.

CC&R's are nasty because they are not consistant. They vary widely, and in ways that are not rational to an observer (e.g. two adjacent lots may have CC&R's that are completely different). Also, you as a buyer have *no* choice about accepting the CC&R, as they are filed with the land and run with it. Since they are inconsistant, it means that each must be fought individually, and there is no precedent being built by getting one changed. I feel that there are may also be some constitutional questions in situations where *no* antennas are allowed. (My last house had CC&R's that prohibited all antennas. I had thought about putting up the tower and sweetly asking them to take out their garage door openers if the neighbors protested, but I decided against it :^>)

Covenant violations can get nasty and expensive if the neighbors are a**holes. I personally don't like spending time talking to lawyers and judges to establish an expensive legal point. Also, many people who would be interested in radio just don't care to fight with architectural committees, neighbors etc. just to put up an antenna.

I have a KLM 2M-14C and a KLM 440-18C for my oscar antennas. They are well constructed, and I've never had a problem with them. The choice of number of elements will depend on which satellites you want to use, though. The two antennas I use are somewhat short for use with Oscar-13 except when its pointing angle is very small (ie. its beams are aimed in my general direction). This occurs each apogee, so it's not a major problem, but you won't have access to the satellite during other portions of its orbit.

For Microsat work, my antennas are just the right trade-off between beamwidth and gain. A longer antenna would be more difficult to keep aimed at the rapidly moving satellite.

I use a U-110 for elevation control, but would not recommend it unless you absolutely could not afford a better rotor. It doesn't have continuous antenna location feedback, only a very poor "click-type" indicator. For satellite work, you really should have a much more accurate elevation indicator. In addition, you would have to add you own antenna position feedback to use computer-controlled antenna aiming (which is a BIG plus on the low-earth-orbit satellites).

Subject: DR590T Remote Control
X-Acknowledge:

And now the long awaited jinglish - english translation for the remote control of the DR-590t by a transceiver with DTMF. (and as a bonus a big disappointment)

The following is a direct copy of the info Alinco was kind enough to send me. [my comments appear in these brackets]

1. Set frequency
    a, go to vfo mode and set desired frequency on the DR-590T, and fully open squelch. ("Busy" indicator will appear).
    b, Set same frequency on the remote Transceiver, and fully open squelch.
    [not necessary]

2. Set Remote Channel and access code.
    a. enter C10 on the DR-590 Touch Tone Mic Pad. *the frequency display will flash).
    b. Enter channel selection (one numerical digit (1-4) and an access code (three numerical digits) on the DR-590T touch Tone Mic Pad. [it would be good for you to compare this part with the DSQ function descrition in the manual so that you can see "What is realy happening here"]

3. Enter DSQ function in the DR-590T
    a. enter C!@ on the DR-590T Touch Tone Mic Pad.
    (DSQ indicator will flash)
    b. Push the PTT on the DR-590T Mic.
    DSQ indicator will stop flashing and the "busy" indicator turns off)
    c. Press the "f" (function) key and the MHz (up) key. The DSQ starts flashing again, and there will be a confirmation tone.

4. Access Remote Transceiver to DR590T
    a. From the remote transceiver, transmit same DTMF access code (three numerical digits) as set into the DR-590T. The "Busy" indicator turns on the DR-590T (normally, you will hold the PTT on your remote transceiver and push the appropriate DTMF tones). [???? Jinglish again ?!?!?!?]

5. Initiate remote control commands
    a. From the remote transceiver, transmit the desired "C" code (see page 14 of the DR-590T manual) from the dtmf Touch Tone Pad.

b. If you want to perform an additional remote commands you must remember to put the remote transciever in the same frequency that the DR-590T may be in. [how in the hell do you know if you are remote from the DR-590 and if you err durring a remote command how do you recover . . . more on this later] Retransmit the access code and the desired "c" code.

6. Cancelling the remote control function and turning off the dsq function

a. If the DSQ indicator is not flashing, enter C12 on the touch tone pad of the dr-590t. the dsq will start flashing.

b. With the dsq indicator flashing, press the MHz (down) button once. The dsq indicator will turn off.

--End of instructions from Alinco --

Now the bummer
This function does not allow you to control frequency selection/etc on the other band. (i.e. from 440 you cannot switch over to 2meters and change frequency and then go back to 440). You cannot operate this function in conjunction with any of the memories, you must remain in VFO mode. This function does not opperate in cross band remote mode.

I am a bit miffed that Alinco didn't see this through. They could have created the all time worlds greatest mobile rig that would allow one to access it via 440 and then work any of your favorite 2 meter repeters operating as a remote base. They even saw fit include a dtmf function that allows you to remote key the transmitter (rather than running as a repeater). This in conjunction with the other functions that are 1/2 implemented certainly say something about Alinco.

Counter point
It is still a great radio and I would buy it again still knowing what I know now. The only differance is that I wouldn't be as disappointed when I found out that the rig doesn't "really" do all that Alinco says it can do.

Any way I hope you enjoy your rig as much as I enjoy mine.

Congrats to Mike Gauland on his new ticket. Yes I suppose enjoying CW is "unpopular" politically but you are not alone. Many people like code we just don't talk about it ....

Tad said that 5 upm is bare usable . . .Right-on! Mike, now you will find yourself sitting for hours having a cw qso with someone. You will have a lot of fun, no doubt at all, but . . . when you get up in speed to 13, 15 and 20 wpm you will begin to find you have just as much fun (maybe more) and you still spend hours at the rig, only difference is now you can actually talk with your key.

```
example
Novice: (this takes 10 min. so you must ID every time)
        kx7xxx de kz7zzz bt
        blah blah blah . . .
        blah blah blah . . .       [z transmission]
        etc
        kx7xxx de kz7zzz kn

Extra: (this takes 10 min.)
        kx7xxx de kz7zzz bt
        blah blah blah . . .       [z transmission]
        blah blah blah . . .
        etc KN
        blah blah blah . . .       [x transmission]
        blah blah blah . . .
        etc KN
        blah blah blah . . .       [z transmission]
        blah blah blah . . .
        etc KN
        blah blah blah . . .       [x transmission]
        blah blah blah . . .
        etc bt
        kz7zzz de kx7xxx KN
```

So cw becomes more converational. Eventually you will be able to copy it in your head just like when you listen to someone talk. Trying to realize this (for myself when I had my novice) was like being a child who barely knows the alphabet and trying to read shakespear! Keep working at it and you will be there in no time, all it takes is daily practice.

The reason (as I see it) for the "class" structure is to reserve some portion of the band for "high speed" cw operators. If you look at the band plan, you dont gain all that much spectrum by upgrading. And unless you want some of the other privalages (being a VE) you really have no reason to upgrade unless you want to get into high speed cw and use those reserved portions of the band. I suppose there are those that think of the classes as a caste system and that Extras are "better" than generals, or techs but that is a realy stupid reason to go through the trouble of upgrading.

By the way I support the no code licence as long as the CW bands don't change so that we can still have our kind of fun. [a possibly lame attempt to quell a flamefest :-)]

Keep working at it mike, hope to hear you in the lower edge of the band some day soon.

Here's the exact quote from FCC rules regarding exam grading. This is Part 97.29 (C) entitled "Examination Grading."

"An applicant passes a code element if he/she proves his/her ability to transmit correctly by hand key (straight key or electronic keyer, but not a keybaord keyer) and to receive correctly by ear texts in the international Morse code at not less than the prescribed speed during a five-minute test period. Each five characters shall be counted as one word. Each punctuation mark and numeral shall be counted as two characters."

Enough of this, now. The guy is wrong. Face it.

900 AM EST MON OCT 15 1990

GOVERNOR EVAN BAYH HAS PROCLAIMED THIS WEEK...OCTOBER 14 THROUGH 20 1990 ...AS AMATEUR RADIO APPRECIATION WEEK IN THE STATE OF INDIANA. ALL HOOSIERS ARE ENCOURAGED TO RECOGNIZE THE IMPORTANT CONTRIBUTION MADE BY THESE DEDICATED VOLUNTEERS.

INDIANA AMATEUR RADIO OPERATORS PROVIDE INVALUABLE SERVICES WHICH HELP SAVE LIVES AND PROTECT PROPERTY. THEY PROVIDE COMMUNICATIONS EQUIPMENT AND VOLUNTEER THEIR SERVICES TO NATIONAL WEATHER SERVICE OFFICES DURING TIMES OF ADVERSE WEATHER.

AMATEUR RADIO OPERATORS PLAY A MAJOR ROLE IN THE NATIONAL WEATHER SERVICE WARNING PROGRAM. THE WEATHER SERVICE DEPENDS ON TIMELY REPORTS OF TORNADOES...WIND DAMAGE...HAIL AND FLASH FLOODING FROM TRAINED

SPOTTERS. MANY SEVERE WEATHER SPOTTERS ARE LAW ENFORCEMENT OFFICERS... FIREFIGHTERS AND EMERGENCY MANAGEMENT (CIVIL DEFENSE) OFFICIALS. BUT ABOUT 30 PERCENT OF SEVERE WEATHER SPOTTERS ARE AMATEUR RADIO OPERATORS.

DURING MAJOR SEVERE WEATHER EVENTS AMATEUR RADIO OPERATORS WORK OUT OF NATIONAL WEATHER SERVICE OFFICES...SETTING UP SPOTTER NETWORKS COUNTY BY COUNTY AS NEEDED. WEATHER SERVICE PERSONNEL FEED SPOTTERS INFORMATION ON STORM STRENGTH AND LOCATION BASED ON RADAR...AND THE SPOTTERS RELAY REPORTS OF SEVERE WEATHER BACK TO THE WEATHER SERVICE. THESE SEVERE WEATHER REPORTS HELP WEATHER SERVICE FORECASTERS TO DECIDE WHERE AND WHEN TO ISSUE TORNADO...SEVERE THUNDERSTORM AND FLASH FLOOD WARNINGS.

DURING THE JUNE 2 1990 TORNADO OUTBREAK...DOZENS OF TIMELY REPORTS FROM AMATEUR RADIO OPERATORS THROUGHOUT INDIANA ASSISTED IN THE WARNING PROCESS.

IN ADDITION TO SEVERE WEATHER OPERATIONS...INDIANA AMATEUR RADIO OPERATORS PROVIDE DAILY RAINFALL OR SNOWFALL REPORTS TO THE NATIONAL WEATHER SERVICE HYDROLOGIC PROGRAM. THESE WET NET REPORTS ARE USEFUL IN PREDICTING RIVER STAGES AND FLOODING.

AMATEUR RADIO OPERATORS ARE A DEDICATED GROUP OF VOLUNTEERS WHO HELP THE NATIONAL WEATHER SERVICE PROVIDE THE BEST POSSIBLE WARNINGS AND FORECASTS TO THE PEOPLE OF INDIANA. HATS OFF TO THE INDIANA AMATEUR RADIO OPERATORS.

I have a Heathkit HW-100 that I use almost exclusively for CW (yeah, yeah I know). I picked it up used (no kiddin') and it has the SSB (2100 Hz) filter in it. I've found filters available from Fox-Tango and I think I want to get one. My question is this: they have 400 Hz and 250 Hz filters - do I want the tighter one, or are there tradeoffs between tighter filters and wider ones (i.e. is it difficult to tune, etc.) There is no provision for switching between two filters, so unless I rig something up, I will be stuck with whatever is in there. I know I won't be able to work SSB, but that's OK (with ME - only with ME). Any advice would be appreciated.

Oh yeah, one more question: If I am in an accident and my car will blow up in a few minutes and there is no one else to go for help and my HT has been modified to work on police bands and there is no repeater around (whew), is it OK to call the police on it? But wait! Blood from a severed artery has leaked into the HT and ruined the microphone! I'll have to use code! Thank God I had to learn it to get my license. But my VE never tested me on sending code with a HT mic button! Should I sue him/her if I get out of this alive? What a dilemma! :) (Sorry, I couldn't resist)

73,

Anyone have any experience with 2m J-poles made from 300 ohm flatline? I need plans, dimensions, references (couple of years back in 73, I think, but I can't find it....). Please e-mail and I'll summarize to the net.

Thanks in advance,

>Heathkit

The current stuff sold by Heathkit is rebranded Japanese equipment. I don't know who is making their equipment this week, but lately they've been selling rebranded Yaesu HF gear and Standard Electronics of Japan HTs. Buying from Heath is kind of like buying from Sears. You won't get the best deals and you may have trouble getting parts after they change vendors, but the equipment will be generally serviceable.

>Alinco

Alinco is a minor Japanese inport. Features are great, price is reasonable, but quality is spotty.

>Kenwood

Kenwood is a major player in the ham market. Be aware that these are high margin products. Look for major discounting. The quality of the HF rigs is top notch. The VHF/UHF equipment quality is spotty. Their HTs are small and feature laden, but some models are fragile.

>Motorola? <- Do they make Ham HTs or just commercial two-way tranceivers?

Motorola makes several grades of HT that can be used in ham service. They have a limited number of channels (from 2 to 16) and don't have the gee whiz features of the Japanese radios. They are extremely rugged physically and hold up well in extreme RF enviornments.

>ICOM

Icom is a major player in the ham market as well as the commercial market. Their equipment tends to be pricey. Their philosopy tends toward technical wizardry rather than featuritis. Their receiver frontends generally feature a high intercept point and their introduction of direct digital synthesis has resulted in radios with extremely low noise floors. Except for the micro 2, their HTs have been known for their ruggedness. The IC-2AT is the standard by which ham HTs are judged. Their VHF/UHF gear is generally excellent. They have been playing catchup to Kenwood at HF for some years. Their new HF series is superb.

>Yaesu

Yaesu has been considered a second tier company in the US ham market. This is changing rapidly. Their new HF equipment is top line and their VHF/UHF gear is excellent as well. In particular the FT736 is excellent as is the FT1000 HF rig and the FT470 HT. These radios tend to be feature laden with some sacrifice in intermod performance. Pricing is somewhat better than Kenwood or Icom.

What do I own?

I own and abuse the IC-2AT, the IC-4AT, and the whiz bang FT470 HTs. Lately I find myself carrying the FT470 most often except when I will be in an extreme RF enviornment like a mountaintop repeater site.

I own and abuse the IC-900 and IC28H mobile rigs. I have had no problems with either of these rigs even though the IC-900 is mounted in a Jeep.

My main VHF/UHF base rig is currently a Kenwood 790A. This radio has caused me a world of grief. It replaced a IC451A and a much beloved IC211 that suffered a severe lightning hit. The Kenwood suffered a 440 power module failure within the first month. The radio is advertised as suitable for use with amateur satellites, yet the narrow filters are not accessable by the downlink receiver. It has frequency tracking for satellite use, but only if you hold a button in while tuning. I intend to replace this radio as soon as possible.

On HF I use an IC735 transceiver both mobile and base. It may not be the DXers dream, but the receiver is incredible and the transmitter is solid. My previous HF rigs were an unsatisfactory IC745 transceiver and a wonderful pair of Drake Twins.

My recomendation for an HT? The FT470 dual bander has more bang for the buck than anything else. A used IC2AT would be the best single band HT for the money.

Gary KE4ZV

Because it is there! This is the United States of America... that used to mean freedom and personal responsibility.

Let me take a different tack and discuss driving:
You are certainly capable of driving your car across the center median and directly into the path of oncoming traffic. We have laws which state that you shall not do this, but it happens periodically. I see radios as the same thing. I can do it, it is against the law... I choose not to. Capability is not against the law... use is.

Can we please get back to the regularily scheduled program of technical discussions, mods and code wars, now?

>
>I don't understand ... why? Just because the outside antenna can "hear"
>better?

The outside antenna will collect more signal than the rubber duck. When you over drive an amplifier you get spurious products. As an example, think of an HF linear designed to be driven with 65 watts. Drive it with 400 watts and you will be very unpopular. Can you say splatter? The situation is the same in a receiver RF amplifier, only the levels are much lower. When you hit it with too much RF you change the operating point of the amplifier to a nonlinear portion of it's operating curve. Another name for a nonlinear amplifier is a mixer. One way to reduce this problem is to design the amplifier with a large standing current. This strong dc bias requires much more input signal to shift the operating point to the nonlinear region. HT manufacturers don't do this because of excessive battery drain. They don't put in good passive filtering because hams have demanded wide receive coverage and a very small package. It's a tradeoff, if you want a clean receiver you must accept a bigger package with narrow frequency coverage and heavier battery drain.

Forget the Toko helical filter: Its insertion loss is 8 dB. A low loss helical filter would be considerably larger.

>
>This brings me to the deeper question. WHY DO WE NEED ALL THAT MICROWAVE
>BANDWIDTH??
>

The numbers in your article didn't allow any guard band. Assuming reasonably state of the art equipment, doubling your numbers should allow acceptable guard band.

Considering your 35 kbs assumption, I certainly want better thruput than that. Floppy speed of 500 kbs would be acceptable now, but I do want to be able to interact with a X client/server pair in a snappy manner. I do want to be able to program distributed computer systems. I do want to transmit high definition video in real time. I want to do things that are currently impractical because we don't have the speed/bandwidth needed yet. Predicating future spectrum needs on current digital usage is a mistake. There are many potential digital uses that currently aren't being done because the technology to give us the needed thruput isn't available to amateurs yet.

As one example consider an autonomous mobile robot. It transmits high definition video of it's surroundings. It's movements are controlled by a set of cooperating subprograms running on a group of desktop computers all connected by a distributed network. Sounds fantastic doesn't it? Give me the thruput and I know several people who would like to take a crack at it. The lower microwave bands are ideal for this application since conventional omni antennas are still practical. At 10Ghz and above tracking problems would become severe at fairly short ranges.

As another example consider amateur radar. The doppler radar I play with doesn't take up much bandwidth, but a friend of mine is playing with pulse radar for radiolocation. Yes, it's not at 2 Ghz, but it still takes up a big chunk of amateur microwave spectrum.

There's lots more than weak signal work being done at microwave frequencies. Not a lot of people are doing it yet, but as more people learn how to do it, the activity will hopefully grow. If we lose large chunks of spectrum, it'll die on the vine. The few remaining slivers will only be useful to the weak signal DXers and some great experimental work will be lost.

Please ask him under what authority he is doing so. The reason for type acceptance is to preclude the need for technical inspection of individual pieces of gear. Guess what every piece of "modified" ham gear must go through before it may be used on CAP frequencies? Right -- inspection by a commercial licensee to ensure emmission and stability performance.

Each amateur licensee is granted the authority to certify his own gear when used in amateur use. That is why home-brew amateur gear is legal. That's also why there is a technical exam.

The certification remains with commercial licensees for non-amateur use. This certification overides type-acceptance.

Unless your FCC friend can provide other documentation, that is.

This is my signature. It doesn't contain my name at all!

Hi all,

a friend of mine asked me to forward his mail to this group:

------------------ cut here --------------------------

Hi all,

I soon will be a radio amateur. I own an Atari Mega-ST 2 and so I am looking for all kinds of soft and hardware referring to ham radio.

Especially I am looking for wefax-software, packet radio programs, CW-decoders (Hard AND Software).

Perhaps somebody could give a hint to me and tell me where to get such things !!

Thanks very much.

Write either to: 100012.1123@compuserve.com   or
                    fendrich@salyko.doit.sub.org

Thanks again!

Thomas Knauer

Did anyone see the CBS report on the usage and missuse of low power RF devices. This segment was aired October 12 in the late night spot.
I was much disturbed by the view put forth by CBS that people who use scanners are doing something unethical and that the radio spectrum should be opened up to commercial interests. The person CBS invited to give the opposition position (i.e. that it is ok to listen to short wave radio and other frequencies) was not given much opportunity to talk.
I will be writing CBS to express my views and I hope that many others will write them

There seem to be a number of misconceptions regarding what will
happen during the SAREX operations, though Patty (winter@Apple.COM)
clarified a number of things very well.

First, not all of Ron's downlink time has been allocated. He will have
time to talk with whoever he happens to hear. Look at the schedule I
posted back in September, anytime during the "crew tended" portion of
the SAREX schedule that is not between LOS and AOS of a specific
ground station is free time. For example, between MET 1/10:31 and
MET 1/12:00 Ron has no scheduled contacts.
If you didn't get a copy of the schedule I posted, send me mail at
gmorris@nasamail.nasa.gov and I'll mail it to you. The fact is there
just isn't a whole lot of free time while Ron is within sight of the
U.S. He only has a hour or two at the beginning and end of his shift
that is available for SAREX ops. Then you take out scheduled time
and time where he is not in range of the U.S. and there isn't a whole
lot of time left. I haven't taken the time to analyze the schedule
to find the free time where he is over the U.S., yet.

Patty correctly described the bridge contacts, Ron will talk to
amateur ground stations via his 2M radio, the ground stations will
use phone patch to a amateur repeater near the school and the school
will have a amateur radio set talking to the repeater. On the time-
line I posted these are the contacts with VK6IU, VK2AS and PY2PJO
and others.

Someone mentioned that Ron Parise was on the day shift, that is not
correct. Ron is on the team that has to stay in the "bright room"
at night for 4 days before launch to timeshift their circadian
rhythm (bright it is, 30,000 lux).

As far as QRM is concerned, scheduled QSOs are not on the announced
frequencies, so there shouldn't be a problem there. Plus most of
the school QSOs occur over Australia and Brazil.

>

You're right, it sounds awful. (etc)

David

What do you mean, awful? I've had some great CW dreams - in one, I was in Benin (TY) listening to a CW pile-up, it was pretty neat. One of my better dreams.

The really awful dreams are those where you are in an SSB pile-up, shouting and shouting and shouting and not getting through the pile-up. I hate it when that happens.

David Stark, the famous flaming newbie, flames again:

> Yes, I agree, there is a training problem. There is also a big attitude problem (spelled P-O-L-I-T-I-C-S) about "making" vollies take any kind of training.

Just because someone's not paid to do a job doesn't mean they can't do it in a professional manner. My 9 years in EMS were entirely volunteer, yet I received as much training as any paid paramedic in Texas (about 900 hours, between the various levels of EMT training and American Heart Association Advanced Cardiac Life Support certification). If they don't want to get trained, they shouldn't be out there.

> I never said they didn't need EMERGENCY communications. I said they don't need modified ham radios for routine operations and daily "radio checks." If they were properly equipped with legal radios for their day-to-day ops, then they would have legal commercial radios during emergencies, too, wouldn't they?

You must have been reading a different discussion than the rest of us. We were talking about use of modified ham rigs in emergencies. It's apparent you don't even bother reading before flaming.
Nobody was defending use of ham rigs during routine ops. Just EMERGENCIES.

> OK, Jay, if you will keep reading my messages until YOU understand them. I was not referring to emergency communications. These EMS officers/firefighters/whatevers DO NOT NEED AMATEUR RADIOS FOR THEIR DAILY AGENCY OPERATIONS.

Well, ** EXCUUUUUSE ME!!! * We were talking about EMERGENCIES. Period. The EMS officers need radios during routine ops, but that's a separate issue from using ham rigs during EMERGENCIES. Have you figured it out yet?

> Only inflammatory to people who believe in their inalienable right as a ham operator to transmit on any frequency to which they think they ought to be entitled by perceived loopholes in the rules. It just ain't so.

(I liked the way you deleted my qualifications and left yours...)

In an emergency they DO have such a right. IN AN EMERGENCY, THE RULES GO
OUT THE WINDOW. Keep repeating it, since it obviously hasn't sunk in yet.

Yes, I also saw that show and was pretty horrified. The segment before the swl-er, had CBS's "science consultant" - his name escapes me, but he's the former host of the PBS Newton's Apple show discussing frequency congestion. Lots of talk about navy radar "jamming burglar alarms in San Diego" (I thought it was garage door openers?).

All of this was presented at about a 3rd grade level, by a pair of co-anchors who later demostrated their techo-prowess by explaining "smileys" (:-), ;-), etc.).

What an awful show, and as the previous poster mentioned, very unresponsible. I would not worry though - I doubt many people were listening to this drivel, and you can bet the show will be cancelled in short order...

Fred R. Goldstein and Bob McGwier responded to my deliberately inciting posting where I ask: "WHY DO WE NEED ALL THAT MICROWAVE BANDWIDTH??"

--- Comments on Bob's posting -------

Thanks for your comments - though they are fully as despondent as my own feelings about keeping the microwave bands. As you point out, AMSAT is only likely to be able to show need for a few MHz, not many times more than the EME and terrestrial weak signal crowds would like (per band).

--- comments on Fred's posting ----

I calculate some AVERAGE channel capacities needed by 2 to 1000 hams doing a lot of large file transfers.
Fred calls me to task, saying:

> Interactive applications require averaging over milliseconds or seconds.

My response: Just because I average over a minute, doesn't mean that the traffic statistics will cause you to wait a minute. I could have averaged over a second, and come up with about the same results with more than a few stations. ie: 28 stations using 35 kbit/s each is about 1 Mbit/s

Regarding occupied bandwidth, Fred says:

> Okay, you've gone WAY wrong.
> First off, you have to translate the digital to analog (bandwidth)
>domain. The ratio is a cost tradeoff. Fairly cheap (FSK, 2PSK) radios will
>give you about 1 Hz/bps or worse;

I say: that is the number I implied...

> But higher efficiency costs a bit more; 6 bps/Hz is possible,
> but you have to be the phone company to afford it.

I say: .. and have a good S/N ratio... HEY FRED, I was trying to say we NEED the bandwidth, not that we need even less.

> Second, what is the latency we're tolerating? We do a lot more than
> transfer files with our computers, and would like packet radio to be
> like that. NNTP (news protocol that we're using now) polls each
> article from the server to the reader when you ask for the "next" one.
> How long do you want to wait? At 1 Mbps, it's pretty good. At 1200
> bps, it's hopeless.

I say: Don't you have computing power locally? Can't you transfer the mail in bulk and read the individual messages locally? Anyhow, just 'cause I averaged over a minute doesn't say you'll wait a minute. How long does it take you to read a 4 kilobyte mail message? Can't the mail system someday be smart enough to transfer one message ahead, or even all new messages? With personal computing power at home, we shouldn't demand to be allowed to remain stuck in the past with a mainframe-does-everything attitude.

> Should I even begin to mention remote graphics like the X Window System,
> which require interactive speeds in the 64 kbps range to be useful?
> It's not the average over the day, but the latency per message, that
> counts.

I say: Again, don't you have local computing power? Anyhow, it generally takes a while to interpret a screen before you want the next one. Since I gave you 35 kbits/s of a 1 Mbit/s (say) channel, we don't seem to widely disagree on this one.

> Also, a 10 MHz band is too small for repeaters. If we had two 10 MHz
> segments about 80 MHz apart, it would be a lot easier to separate the
> input from the output, in the 13 cm. range.

I say: Easier, yes, but 10 MHz spacing would just be the 600 kHz of 2 meters scaled to 13 cm. With 1 MHz bandwidth repeaters, something like 15 to 20 MHz separation might be a better scale-up - though antenna directivities are a LOT better on 13 cm for a given physical size.

I then talked about how much bandwidth TV (raw analog or 1 Mbit/s compressed) takes, the idea being to show that TV is a bandwidth hog (either way) which is what is NEEDED to actually fill up the bands. Regarding compression,
Fred says:

> That's not exactly true either. If you're talking about
> "teleconference" video, the "talking heads" application, then you're
> right; for maybe $20-30k, you can compress down to 256 kbps and be only
> a little jerky. (That's hardly an ATV price range.) But "full motion"

I say: Why do hams need more that "talking heads" ;-(Also, today's price won't protect bands tomorrow.

> But "full motion"
> video, equivalent to a 6 Mbps analog channel, takes about 45 Mbps with
> That's when you have real moving pictures, like the broadcasters use,
> and not just faces against a backdrop. Try watching a western through a

I say: ABC news has been using compression to
get two TV pictures into 45 Mbit/s (T3) between NYC and DC for a number of years. Do you complain about their picture quality?

> Clearly the 2300 MHz band is a ripe target for plucking. Few hams
> use it. But that doesn't mean we should be happy with microwave sliver
> bands.

I say: My posting was intended to demonstrate HOW we have at least SOME chance of fully occupying the microwave bands with a plausible number of hams. It's not packet text, not file transfers, not weak-signal CW, not X-windows, it's TV, TV. Everything else will "fit in the cracks".
Am I on amateur TV? Well, no ......

>
> I'm sorry the personnel in your area are so poorly trained that they cannot be depended on not to get on the radio unless they really need to. The solution to that problem is training, not prohibition. People get into

Yes, I agree, there is a training problem. There is also a big attitude problem (spelled P-O-L-I-T-I-C-S) about "making" vollies take any kind of training.

> help. I suggest you post your opinions on FireNet (the FidoNet fire/EMS echomail conference) about why the average emergency worker doesn't need communications. Put your bunker gear on first.

I never said they didn't need EMERGENCY communications. I said they don't need modified ham radios for routine operations and daily "radio checks." If they were properly equipped with legal radios for their day-to-day ops, then they would have legal commercial radios during emergencies, too, wouldn't they?

> > Even the ones who have positions reuiring the use of an individual radio have no business utilizing a non-type-accepted ham rig as that radio!
>
> ...except in an emergency. Repeat after me: THE RULES GO OUT THE WINDOW IN AN EMERGENCY. Keep repeating until you understand it.

OK, Jay, if you will keep reading my messages until YOU understand them. I was not referring to emergency communications. These EMS officers/firefighters/whatevers DO NOT NEED AMATEUR RADIOS FOR THEIR DAILY AGENCY OPERATIONS.

> > He specifically stated that he was trying to use a non-amateur repeater. People who want CAP and MARS mods usually say so.
>
> I hate to tell you this, David, but CAP and MARS repeaters aren't ham repeaters either. Why don't you ask, and then THINK, before you flame? Or is that too much to ask?

But ham licensees can be members of either organization BECAUSE they are ham licensees. This is not likely with Public Safety organizations, businesses or other "non-amateur" radio services.

> >   I disagree strongly. And I don't think 2 years in FidoNet and 7
> >years in Public Safety communications plus 9 years as a licensed ham

> write _anything_ yet that _wasn't_ inflammatory. Yup...you sure qualify as a
> newbie. The least you could do is not flame everything that comes along.

Only inflammatory to people who believe in their inalienable right as a ham operator to transmit on any frequency to which they think they ought to be entitled by perceived loopholes in the rules. It just ain't so.

I am looking for any and all companies that make computer logging programs.
Specifically I am looking for the following:
- Computer control / Data acquisition from a Kenwood HF Radio
- Awards tracking (WAZ, WAS, DXCC, etc)
- QSL label making / tracking
- Terminal emulator for packet
- Terminal emulator for HF TNC (RTTY, ARQ, etc)
  (At the same time as packet).

If you know of something that does even some of these things please
let me know. I am using a PC/AT compatible computer so programs for this
type of computer is needed.

I have heard of a program called DX LOG, but I do not have the address
or phone number for the company that makes/markets this.

Thanks in advance!

Phil

Hi Dan,

I've recently taken up skydiving, and I use a Yaesu FT-703 with a vox
switch to chat to the people on the ground (I'm still trying to find
a fellow ham to have a two-way conversation with).

As you say, operating while in freefall is not on. (I'm there yelling
"look - reach - pull!" to myself, and *I* can't hear it! In any case, the
boom mike gets blown up to my forehead. The first time I did this, I thought
that the mike had been ripped off completely! :-)

Anyway, under canopy, it works fine. The only problem is that the Yaesu vox
switch enable is on the back of the rig, and so it's hard to get at when
you're crouched in the back of a tiny plane. I usually use it clipped to my
belt, with the carry strap wrapped around the belt-loops on my jeans.
At least, I haven't lost a rig yet :-)

One thing to consider: I presume you want your TCO to give you instructions
to reach the target - he would have to be a licensed ham too. As far as
I know (in Australia at least), there are frequency allocations specifically
for parachuting activities. maybe your national parachuting federation
could advise you here.

> better?

The receiver in a hand held radio generally has a few corners cut in the design to that they can fit it into that sexy little package. The front end is designed to work with the rubber duck antenna that comes with it. Hooking the radio to a larger outside antenna (or even an AEA Hotrod) in urban areas can often deliver strong off-frequency signals to the front end that effectively "swamp" it.

I understand that the ARRL does not do any lobbying because it would threaten the league's tax exempt status.

I have a couple of questions.

1) I've been reading many of the messages posted here about intermodulation on 2m HT due to wide band reception capabilities. I was wondering if it would be possible to just add in a resistor or two somewhere in the circuit board to cut down on the wide-band reception? Would this aid in less intermodulation in the HT?

2) I live in Boston, MA, and have been told that there is not much 70cm activity in these parts, but that 2m is very active. I was wondering if 70cm is active in other parts of the country - namely anywhere not on the East coast (or near the East coast)?

Now that I have passed my Technician exam am waiting for my license to
come from the FCC (and am busy at studying for my General now), although
I am very tight on money, if I were able to squeeze out a few dollars for
a used HT at a flea market or somewhere, wshould I invest in dual band HT,
or just go for the 2m HT?

Thanks for any help.

73s,

Scott

      You're missing the point. Why not force the officials to
provide ham operators (who are usually citizens, voters and taxpayers)
with the same grade of service that all other emergency callers get?

Insist on having them do it the SAME way for EVERYBODY. It's their PR
problem, not ours.

I would call your average flaming response to everyone pretty obnoxious. Read the article again and this time, THINK about it.

The point is, the ARRL Board of Directors advertises quite freely how "accountable" they are to the members. The official ARRL line is that the League is not run by the people in Newington, but by the members. If that is the case, then the members who are actually running the League should be deciding on major expenditures of OUR dues money.

> Politics? You mean like political lines between cities are just
> some annoying inneficient POLITICAL problem?

Once again, you are not replying to what I actually said. There is a difference (on paper) between a dispatch center and a PSAP. Some communities, like yours, actually have their PSAPs physically separated from the dispatch centers. Other communities, like mine, have a single PSAP/dispatch center in one location. My local OEC dispatches for all of the communities in Monroe County except a handful who have their own police dispatch but still get their calls through our 9-1-1 PSAP. To the extent that they prevent the citizens from getting efficient, effective 9-1-1 service, YES those political lines are just a politica problem. There is no other valid reason for depriving the community of a good emergency Public Safety emergency communications system.

> In Seattle, we have a number of surrounding suburban towns. Why

> in the world would these separate municipalities route all of their
> 911 calls through one central PSAP, when they can use selective
> routing to put the calls automatically into the jurisdiction that
> serves the caller?

They would if all dispatching originated from one unified center. With Enhanced 9-1-1, it really does not matter where the caller is or where the PSAP is. The ANI/ALI takes care of the caller's location and the dispatch center selects the agency. I should point out that I don't think my local OEC is the best-designed place. The PSAP should really be in separate redundant locations and the dispatch facility should be more secure.

> were talking about use of modified ham rigs in emergencies. It's apparent

> you don't even bother reading before flaming.
> Nobody was defending use of ham rigs during routine ops. Just
> EMERGENCIES.

Sorry, but equipping people who have some legitimate business on Public Safety channels with legal radios completely eliminates the need for modified amateur equipment AT ANY TIME.

> The EMS officers need radios during routine ops, but that's a separate
> issue from using ham rigs during EMERGENCIES. Have you figured
> it out yet?

It's the same issue in my community. Ham radios are cheaper and easily modified. What do you say to the PS "professional" who decides it would be better to talk on the 2 meter freqs on his modified portable, but who does not happen to possess a ham license? That is also the same issue.

My point, and my OPINION, is that nobody NEEDS a modified ham rig to use on non-amateur frequencies. Licensed hams don't need them. It doesn't matter if they belong to the rescue squad; they should be using equipment that was type accepted for Part 90 service.

Agency members who are not licensed hams have no legitimate use for any amateur equipment - period.

> In an emergency they DO have such a right. IN AN EMERGENCY, THE RULES GO
> OUT THE WINDOW. Keep repeating it, since it obviously hasn't
> sunk in yet.

I can't repeat a lie. The rules don't go out the window, because there are rules governing emergency communications. The attitude that the rules can be broken whenever the operator feels it is justified has got to go out the window.

The justification for the amateur radio service as an emergency communications resource for the community was never based on our ability to make our radios transmit on police frequencies. ARES and RACES do not build their disaster plans on hams using non-amateur frequencies during disaster operations. Hams are authorized to provide a unique and valuable emergency service, but only WITHIN THE FREQUENCY BANDS ALLOCATED FOR HAM USE.

Jay, we probably aren't ever going to see eye to eye on this issue. We may not even agree (ref your comments above) that we are even having the same conversation. Let's not clutter up the echo/newsgroup with our argument. I have stated my position and you have stated yours. Let's acknowledge each other's right to our respective opinions and interpretations and leave it at that. 73.

Is it true that a module is available for the Motorola MT-1000 which
will allow Keyboard entry of frequencies without the aid of a RIB or
PC ? I was told this version is called the "Service shop MT-1000" or
something of sorts. I would appreciate any further information from
readers who have the inside word.
Tnx,
Rich

Actually the extra attenuation might be a "good thing". The basic problem is after all front end overload. As you say, a minimum insertion loss cavity would be about 10" in diameter and 3' tall.

> be capable of RCC splits with amateur transceivers?
>

1. And how do you know it is an RCC split the requestor wanted? You know for sure that that split is used exclusively for RCC, and not by something else as well? There is a whole world of communications, and a whole world of splits. DO you know of a 765 kHz split? I do. So, we still have no proof of what the original requestor wanted the split for.

2. Last time I checked, there was no regulation about not using strange splits for oddball use in the ham bands. Please post chapter and verse if there is.

3. I don't think hams need out-of-band capability. However, being a ham is not exclusive with being an EMT, Firefighter, MARS, or CAP. Neither is being a ham mandatory for any of those. So, it is feasible for those hams who are involved in other activities to use the out-of-band capabiities of the equipment they already own, provided it is certified

properly.

4. There is one real good reason to use modified ham gear when possible. It is cheaper. Who generally pays for modified ham gear? The user. Who pays for the Motorola gear? The taxpayer. Which gear will the user take better care of? Which one does he have a financial stake in? Are the taxpayers better served by buying a lot of commercial HT's and forbidding use of ham gear, or by outfitting another rescue unit and letting the volunteer members of the squad use ham gear?

5. When you get down to it, nobody needs anything. People were able to live quite happily before radio was invented. Same with electricity. Airplanes. Cars. The Wheel. However, they were invented, and people live (maybe) better than before. The point is, ownership of a radio capable of transmitting RCC splits, at RCC frequencies, is NOT illegal. It is not illegal to own a radio capable of transmitting at the local police frequency. It is not even illegal for a non-ham to own ham transmitters.

This is my signature. It doesn't contain my name at all!

```

Phil,

You're looking for a lot in the same package. Here are some I know of:

DXLOG - PAYL Software (see ads in National Contest Journal). It tracks DXCC, WAZ and Oblasts. It has QSL labels. It doesn't do packet, yet, but is planned for a release soon.

EASY-DX - MFJ - this package has a TNC interface for working with the PacketCluster(tm) software, and same features as above.

These are the two I'm most familiar with. I'm using DXLOG. Both can import data from CT (K1EA contest logger). Some other packages I've heard of:

- N6RJ logger (hr Bookstore)
- KD7P logger
- Master Log (dunno who's this is)
- WB2DND
- several others.

I'm not aware of the strengths and weaknesses of all these programs. I couldn't find too much info in the latest NCJ on anything but DXLOG.

Hope this helps.

jim, AD1C

Part of it is historical, viz., in the early post-WW2 days precision frequency control and stability in the microwave region were unknown. Big, big bands were allocated in the sometimes forlorn hope that with that big a target, we'd manage to land somewhere inside of it.

Well, I am not up on these sort of things. I guess I just assumed too much.
We have a centralized dispatching system here, but I guess we smaller

```
communities can do this sort of thing a lot easier than the big cities.

> Tad sez:
>

> or ALI.

I guess they just get a call and a blank screen or a message that indicates
it is a non-ALI call.  But do they give out these numbers easily?

> Phil sez:

It does not need to be a ham radio issue.  There are plenty of examples of
need for certain numbers to be properly identified to a dispatcher.  You
do NOT want an ambulance to run to your repeater site when someone is
bleeding to death on the interstate 20 miles away.

Show me an administrator who would not agree with the fact that certain
phone numbers need to tell the dispatcher about the special circumstances
and I'll show you an administrator that DESERVES to have done to him,
things that would get an ordinary person pissed off, and I'll show you
an administrator that DESERVES to become unemployed.

An emergency dispatching system is NO PLACE for political squabbles.
They should do the job or get someone who will.

```

Because there actually still is a sending test. It's just that the VE's have the option to not include it. The FCC will accept a receiving test as proof sending ability, but the VE doesn't have to do it that way.

It is possible to have a central dispatching point, and the suburban communities can choose to participate or not. Their 911 calls can be directly routed to them otherwise. Then I guess you will need to program your 911 code to call the non-ALI number of the central dispatching point if you happen to be sited in one of these unfortunate communities.

What a silly restriction. I wonder about the person who wrote that in the first place. Perhaps they tried to rule out transmitting antenna?

But there are some cases where you would need to have a transmitter mast (or tower) mounted. As you go up in the microwave frequencies, this comes to look like a more attractive alternative to more expensive coax. The larger coax also has upper limits on the frequency it can handle (not to mention high costs). Then some frequencies are just not practical on any coax, period.

Try getting on 10 GHz and see what I mean.

> >1. Outdoor antennas.
> This sounds like something put in by cable companys!

More than likely by the investor who built a bunch of houses in one area.
The reason is that many people consider antennas to be "unsightly" and
others fear it means RFI and TVI.

> >2. Radio transmitters of any kind. [you better watch that one]
> This is an interesting item, does this mean that I can not have

> restrictions, but even that is not always true.

This is the kind of information we need. If it is the case that there
simply do not exist any choices where one can find a house without such
restrictions, then it might be possible to get another PRB or other
Federal pre-emption on such restrictions.

It might be possible to get it ruled that such restrictions apply only
to those NOT HOLDING A FEDERAL LICENSE for radio transmission, thus
leaving the application of such restrictions GENERALLY in place and
not causing the major uproar a total overturn of them might cause.
We are not fighting the cable industry on this particular issue, for instance.

> So I agree that we need to get the deed restrictions removed. For fun I

> any kind of training.

Sounds like maybe the WRONG politicians are in control there.

Some volunteers definitely don't want to get involved with a lot of training
and indeed prefer to do just certain things. A *PROPERLY* structured volunteer
system will establish a set of things that you can rely on the volunteers to be
able to do based on their training/certication. Don't "make" them take any
training, just provide it and don't "depend" on them unless it is for an area
they are trained in.

I have chosen, for lack of time to get involved, to bypass all training not directly related to storm/tornado spotting for the volunteer efforts I do with the county ESDA. But storm spotting is basically what I do, so I don't need other training. If/when there are other things I want to do, or if I have the time, I might get into some other training programs.

> during emergencies, too, wouldn't they?

I think what should be done here is that the properly type-accepted radios be made available. They are generally not much more expensive than ham rigs. I see some limited capability radios available for with NEW prices LOWER than ham rigs in one of the trade rags.

> Only inflammatory to people who believe in their inalienable
> right as a ham operator to transmit on any frequency to which they

> It just ain't so.

What loopholes? I haven't found any. I believe the FCC rule that allows hams to transmit "by any means" when an **EMEREGENCY**!! exists, is what was actually intended, so it is not a loophole. Those who transmit when no such emergency really exists are in violation of the rules, so again, it is not a loophole.

There are no rules that apply to any form of "crossbanding". There are
rules that apply to specific frequencies in many cases, but none that
affect things done "crossband" that could be done (or not be done if
that is the case) "inband".

A crossband repeater is just as legal as an inband repeater, and has to
follow the same restrictions as well.

What Fred was referring to, I believe, is the fact that radios themselves
tend to (initially for marketed ones) be ONE BAND radios. The 12cm and
13cm bands are close enough to be ONE BAND for the purpose of designing a
radio. In fact they once were one band, and in the rules both stretches
of spectrum are referred to as 13cm.

I modified my Icom IC-32AT so that it can transmit out of band. Did I
need it? YES! But the reason is because of the design of the radio.
You can choose to either have out of band, or not to. But "out of band"
also includes some LEGITIMATE Amateur frequencies, such as 420-440 MHz.

There are also OTHER legitimate uses for a transmitter that is out of
band. One of them is to drive a linear tranverter for broadband usage
of the wider GHz band.

> > In an emergency they DO have such a right. IN AN EMERGENCY, THE RULES GO
> > OUT THE WINDOW. Keep repeating it, since it obviously hasn't
> > sunk in yet.
>
>   I can't repeat a lie. The rules don't go out the window,
> because there are rules governing emergency communications. The
> attitude that the rules can be broken whenever the operator feels it
> is justified has got to go out the window.

I know what Jay meant, though he didn't say it well enough for everyone to understand it.

The real question is when is it justified to violate the OTHER rules as the emergency rules allow for? David suggests that the operator should not do this. Do you mean that they cannot judge when the emergency exists, or are you saying there are some operators who would apply the label of "emergency" in non-emergency situations.

> The justification for the amateur radio service as an emergency communications resource for the community was never based on our ability to make our radios transmit on police frequencies. ARES and RACES do not build their disaster plans on hams using non-amateur frequencies during disaster operations. Hams are authorized to provide a unique and valuable emergency service, but only WITHIN THE FREQUENCY BANDS ALLOCATED FOR HAM USE.

There are levels of "emergency" involved here. Passing health and welfare traffic in and out of an disaster area would count as a low level of emergency and is well within what the B&P rules are about. These are the things we do *AS* hams.

If I encounter an accident where there is a serious injury, and there is going to be a significant increase in response time if I use other than my radio on an public service frequency, then I am going to do it, but *NOT* because I am a ham; I'd do it if I was not a ham. The radio happens to be there because I am a ham. I would also cite amateur rules after the fact when responding to agencies about the matter.

I agree that the "emergency communications" that authorizes the existance of ham radio does not include calling on police/fire/medical frequencies for help. But that does not make it improper to do, or to be prepared to do it correctly and properly.

> Jay, we probably aren't ever going to see eye to eye on this issue. We may not even agree (ref your comments above) that we are even having the same conversation. Let's not clutter up the echo/newsgroup with our argument. I have stated my position and you have stated yours. Let's acknowledge each other's right to our respective opinions and interpretations and leave it at that. 73.

I've read both positions, and it still seems to me that you are not exactly arguing the same points. This is usually when discussion and debate turn into arguments and flame.

  That's one way to fix intermod problems - get the insertion loss
  up high enough! Course if you can stand 8 dB of loss, you can
  just use a resistive attenuator :-)

  In the limit, just leave the antenna connector disconnected.

I find that astonishing that there would be no 70cm activity in the Boston area. While I would expect 2m activity to exceed it, you just cannot put all that would be in Boston on 2m. More likely the person who made that comment either has a pre-conceived notion that 2m's level of activity is the minimum that can be called "active", or else just does not know what he is talking about.

In Boston I would definitely go for the dual-bander. But it depends on what you are interested in doing with it. The 2m band will definitely be more active, but the dual-bander gives you more options, including cross-band full duplex for most of the newer models.

Well, actually, YES. Something that has not yet been brought up is
97.111(a)(2) which states,

"(a) An amateur station may transmit the following types of two-way
 communications:...
 (2) Transmissions necessary to exchange messages with a station in another
     FCC-regulated service while providing emergency communications."

This is quite clear. The only thing that could be argued is the word
"necessary", but if NO OTHER FORMS ARE AVAILABLE, I say that this communication
is necessary. The FCC has already clearly defined emergency and I won't
restate it. I think that about sums up the legality of the comms. The
usefulness or appropriatness of these comms are a separate issue.

My brother has an IC-R100. It is a fantastic radio.

I am considering purchasing an IC-R1, hence I would love to
see more comments on its performance.

I would particularly like to see a comparison made between
the R1 and the R100.

I believe that the R1 isn't quite as good as the R100 spec-wise
but it is hand-held. Just how much difference is there?
Does it fail due to spurious reception, etc.

I talked to the Kenwood rep at PACIFICON this past weekend. This
is quoted from him (i.e., don't blame me):

The TH-77 will appear in the U.S. in about 4-5 months after FCC type
accepting is completed. Price is unknown at present due to the
current fluctuation of the Yen to the $. It will be packaged in a
case something similar to the TH-26. It will use the same batteries
as the TH-75/25/26 etc. It will support direct keyboard freq. entry,
MR clear (a must for some). It is rumored to have dual 440 receive
and it may do cross band repeat.

Your response is that of a well educated young engineer. That by itself does not make it wrong, but there are certain questions of perspective you might consider.

First, although you are representive of the average participant in these newsgroups, your good ol' boy from Texas in all likelihood is not terribly far removed from the statistical mean of scanner listeners in general, who are mostly pretty ordinary blokes. In that sense, the interview was probably not as biased as you would like to believe.

Second, I think your description of the origins of the United States leaves out an essential point. The assumption is true that the founding fathers were striving for limitations on the power of the state to interfere with the citizens' lives; but this striving was, in those times, as much a question of privacy as "unalienable rights". Indeed, given the changes in society since 1776, the average citizen's "expectation of privacy" then was considerably higher than now; and he would have been quite comfortable with the MIT sociologist's views.

Finally, the anthropological concepts regarding territoriality come into play here. Listening to the police, the hams, or even the government is one thing, but invading peoples' "personal space" by eavesdropping on their home cordless telephones or their baby monitors is quite another. Their "expectation of privacy" is likely to become a non-negotiable demand, and since there are several hundred million more of them than there are of us, guess who is going to lose - REAL QUICK!!!

Anybody who would put a transmitter in their house (baby monitors), cordless phones, or use cellular, should realize that they are "transmitting".

IMHO if "their" transmissions are in "my" air then they are "mine".

Anytime I wish converse, privately, with someone I do it over the phone, not over the radio (of any type). Even the police [;-)] are smart enough to do this.

If sombody were to walk outside naked it would be silly of them to protest the glances of a passerby as an invasion of their privacy. The same goes for anybody who uses transmitters indescriminately. I have no sympathy for them.

Isn't it interesting that is basically what saved the hobby in the 1910's?
The government and military, particularly the Navy, had enough clout to
keep us from losing it to commercial interests. As it was, the hobby
was *intended* to be torpedoed by relegating it to "useless" frequencies.
That time the hams didn't totally buy the argument. I'm beginning to wonder
if this time we haven't.
  The first time propagation saved us. This time directed beams *could* but
the commercial interests already know the spectrum's value and we amateurs
don't appear to.

I thought it might be of general interest to many of you if I made the announcement of a new Conference - The Microwave and RF Forum. Accessable directly from RES-Q (tm) (201) 881-7421.

(Also available as Group Mail from 9:100/9 & 9:833/7 as MW_RF)

MW_RF is made available by Compact Software, Inc. soley for the purpose of furthering knowledge within the Microwave and RF community, [and my assurance

of no commercialism].

CSI designs CAD/CAE software for all phases of design and development, so there
are many engineers here who would enjoy the opportunity to participate in roundtables and such...

If you are interested in bringing a forum such as this to it's feet, ask your

local SysOp to obtain the Microwave and RF Forum.

Bill Kreps, SysOp of RES-Q (tm)

> Aye, there's the rub, those last 5 words. The out-of-band
>transmissions, no matter how well-intentioned, are still illegal.

This may be true (or it may not, depending on whether you think an FCC regulation has the same force as a LAW passed by congress).
HOWEVER -- if you are not an employee of the FCC or a Federal law enforcement officer would you please either answer the question (how to modify for out-of band) or be quiet. If I want instruction on correct moral behaviour I can watch any number of TV preachers.

> It is not unreasonable to interpret ownership as intent to use.
>If you can't use it, why go to all the trouble/expense of owning it in
>the first place?

My car is capable of speeds well in excess of 55 mph (in fact, in excess of 120 mph). I suppose by your argument I should sell it (WHAT? to someone who might break the law with it?) and buy a Yugo.

> I don't really care what the next ham does with his equipment,

Yes, you do. Or you wouldn't have gone on so long with your postings.

>or who supports the manufacturers with their purchasing dollars. I do
>care that some jerk is going to modify his HT "because there are no
>rules saying I can't" and abuse the privilege to the detriment of the
>rest of us hams. "Ham operators" are accused by the press of causing
>all sorts of havoc, from interfering with airplanes (when an illegal
>CBer was the culprit) to wrecking TV reception to illegally
>eavesdropping on cellular phone calls (everyone with a radio must be a
>ham). Why invite such bad press by actually possessing equipment
>capable of illegal operation?

Is that ever a non-sequitur. First you complain that hams suffer bad press because of what NON-hams do, then you suggest that the remedy for this is for HAMS to not modify their equipment. Show us that this is a real fear by citing cases where Hams have invited bad press by possessing equipment capable of out-of-band operation -- with the singular exception of CB kilowatts.

I kind of like all the intermod on my Alinco DR-110T. I can program in
my favorite ham repeater and still keep up with public service happenings
and private phone calls -all without ever hitting the scan button. I
almost never miss an important call, especially on 2m! Is there any
mod I can do to open up the receiver to UHF and maybe aircraft?

One very large local municipality (that shall remain nameless :-) is
moving a lot of traffic to trunked circuits that scanners cannot
handle very well. They are then supplying the media (NOT the public!)
with trunking radios programmed to monitor just those trunk groups
that the city thinks the media should listen to.

Trunking and low cost DES scrambling is going to really hurt those
of us who like to monitor police and fire.

I have received a number of irate responses presuming that I MUST have taken
a position when I asked whether we really need all the ham microwave bandwidth.
I viewed it as a way of drawing out positive responses, and making people

think over what should be promoted, and EVEN to shame people into getting on these bands.

One of the flaws I'e noted in ham microwave activity is that there is way below a critical mass of users. Some people spend so much time "getting on" the various bands that they never actually operate. This makes me think that we either need lots more people interested in microwaves, or fewer bands :-(. What activity can attract enough people to get a critical mass? It is surely a chicken-and-egg problem, but even we on these nets (who seem to talk a lot more than actually DO anything) can focus on something that will:

work
be useful
get someone to market kits or gear
be reasonably economical
....

Or can we?

While I am waiting for my Technician license from the FCC and US Snail, I was wondering if there is any type of HF antenna for indoor use to overcome the problems of living in an apartment? I have full access to the equipment at my University's club, but was still wondering if there was any type of decent indoor antenna for HF use?

Thanks.

Scott

(sehrlich@lynx.northeastern.edu)

Congratulations on your new license!

No. There is no "decent" indoor antenna for HF use. Any indoor antenna breaks the cardinal rules of antenna building - keep it as high as possible and in the clear. But don't dispair, there are many usable antennas for your situation.

First, look around and see what you have access to. Any large (and long) metal object may be used. A wire from a tuner to a window sill, bed frame or (if possible) the outside downspout will make an antenna. Try anything metal you can find. If there's nothing metal, try using a single wire from the tuner. Make it as long as possible and as high as possible.

Real antennas will (sorta) work in an apartment. A dipole on 10 meters is only 16 feet long and should fit in any room. Don't worry about bending the ends to make it fit. My favorite antenna is a full wave loop. It's a 1/4 wave on each side and fed through a 1/4 wave matching section of 75 ohm coax. Since most rooms are square - a square antenna may fit nicely around the ceiling. Just pick the frequency that matches the room. 16 feet on a side for 20mtrs, 11 feet for 15 mtrs and 8 feet for 10 mtrs. (These numbers are estimates - see a ARRL handbook for the equations.) Since I run QRP (low power) I can use 22 gauge bus wire available from Radio Shack. It's cheap and nearly invisible. If you're running high power you'll probably want to use insulated wire to keep from giving the cat RF burns.

Lastly, don't forget the ground. If you're lucky you may have solid copper cold water pipe which can be used. NEVER use gas pipe! I wouldn't admit in public to using the ground screw on a 3 wire outlet but I might mention in private Email that it's better than nothing.

I'm often amazed with what can be done with low power and marginal antennas. I've answered stations calling CQ knowing "he can't possibly hear me since my antenna sucks and I've only got 5 watts" and then end up with a nice QSO.

Good Luck. Let us what you decide to put up and how it works.

Bill - WA7NWP

p.s. I'm finally in a house with room outside for antennas. Every weekend my landlord is gone - I put up a new antenna.

Radar detector owners may be happy to note that the efforts of an auto insurance company to deny coverage to owners of car radar detectors was defeated in California. The Radio Association Defending Airwave Rights Inc. (RADAR) was joined by the California State Department of Insurance and the Independent Insurance Brokers Association in defeating GEICO, the insurance company who wanted to deny coverage. The case was before the California Insurance Commission. There was no indication if GEICO planned to appeal the decision.

Provided it is certified properly. There is more to certification than type acceptace. Transmitting out-of-ham-band with ham gear is not illegal, just because it is out-of-band with ham gear. I have 4 pieces of gear I use, almost exclusively, out-of-band, and all 4 are legal.

> the first place?

Unfortunately, the out-of-band mods don't limit what out-of-band may be used. The HF rig I have has the out-of-band mod (a switch) which allows 100kHz to 30MHz xmit, even though I need only one frequency. In this case, it is quite unreasonable to interpret my ownership of this radio which may transmit on 5696 kHz as intent to transmit on 5696. I went to the trouble/expense of ownership for legal use, the rest just fell out because it was cheaper for Yaesu to allow all than some.

Would you also paint the person who just passed his exam and buys his first rig at the same hamfest as doing something illegal? He has no license yet, but has ownership of something he can't use. Yet. This must be intent to use, so he is illegal.

>   I don't really care what the next ham does with his equipment,

> rest of us hams.

Ok, too. But this contradicts the previous quote. Modifying an HT is an easy way into illegal activity, but it wouldn't take too long to build, from scratch, a radio that would screw up the local police. The circuitry in my HR-12 is pretty trivial. Forbidding HT mods just because the HT might be used for wrong purposes is like closing the front door but leaving the windows open in winter and expecting to keep warm.

> capable of illegal operation?
>

In case you haven't noticed, the press will report what it wants, despite what reality is. This is no reason for us to throw away anything we own, just because it might be used for illegal purposes. If we fell into that faulty logic trap, we would need to throw away all radios that transmit (they are all capable of malicious interference -- illegal), many TV's (do you have one that receives cellular freq's?), computers (heaven forbid, I might break into a network with one), printers (to print forged documents), automobiles (I might drive to the liquor store to hold it up), and books (usable as a weapon in an assault.) Alligator clips (errr, roach clips), screwdrivers, empty bottles, the list of items that would assist illegal activities is endless.

None of the equipment I own has caused bad press, nor invited it. I am not sure how they would even know I had it, unless they read this newsgroup. Since it is not used for illegal activity, there is no bad press possible. And what do you think the press would report if the original poster uses his equipment while on a fire call and saves 2 lives? "Fireman uses illegal equipment" or "Fireman saves 2"? I know what slant I would use if I were a reporter and discovered non-certified equipment in use: "City too cheap to properly outfit firemen." How likely would I be to find that last one out? Not very. The use of personally owned equipment just isn't that big a deal.

This is my signature. It doesn't contain my name at all!

Some of the comments relating to spectrum usage bring to mind the work I was involved with before I started working on my (current) thesis topic. Check out my paper in the 7th ARRL Networking Conference.

In particular, there is a strong need for a "spectrum efficiency" quotient which could be applied to a particular service requesting spectrum. The need for this sort of quantification is pretty well demonstrated by tradeoff between multiaccess ("packet radio") and monoaccess networks; compared to link type monoaccess networks, packet radio is very inefficient spectrally at microwave frequencies.

It's also worth noting that you can build really cheap (<$1000) DS0 ground stations for a geosync satellite, when using L and C band links.

This is just to confirm that the modification that was posted to the Alinco DR110T also works on the DR112T (same radio, but with an LCD display as opposed to the DR110T's LED display). Pop the cover, cut one wire, reset the radio, and PRESTO! Instant expanded coverage.

I verified that the radio will receive the National Weather Service. However, I haven't tried listening to the 300 MHz or 800 MHz segments the radio now covers. I have no idea how well (or how poorly) the receiver performs at those frequencies.

Strike a blow for Ham Radio.... write letters.

In the September issue of OFF-ROAD magazine, they published pictures of a tricked-out truck that included a CB amplifier.

I wrote the magazine a letter which they published in its entirety in the November issue which explains some things about CB amps, hams, and reliable emergency communications.

Also, interestingly, my father, also Ron Miller, got a letter published in the same issue. His letter was about gas mileage.

The word processor is a mighty instrument!

I have two BAUDOT teletypes that I need to get rid of. As opposed to sending them to the scrap yard, I would like to see them go to someone who wants them.

I haven't messed with them for 8 years, but I think one is a Model 13 orr 15, and the other is a model 19, (w/paper tape punch). I also have a paper tape reader that goes with the Model 19, and a stack of manuals from American Teletype Corp.

Comments, tips on disposal, etc. will be greatly appreciated. My dad wants the ccorner of the garage back, and he is giving me until christmas to get rid of these things myself...

I had a problem with my TH-25AT overloading anytime I connected it to an external antenna. The S-meter would read full scale *all the time*. I was able to subjectively improve its sensitivity by putting a 10db pad between the HT and the antenna. This apparently reduced the level at the first mixer enough to eliminate most of the intermod. Kinda seems counter-intuitive that adding attenuation would make it easier to copy weak signals, but science is that way sometimes...

Of course this also attenuates the transmitter by 10db, but I can still hit the repeater ok, so what the heck.

Anyone know the effect wire insulation has on the length of a resonant
dipole? I've always used the formula 468/freq to calculate the length
of bare-wire dipoles. What does the numerator change to if the wire
is insulated?

> What grade of service does everyone else get that allows 9-1-1 callers
> to DICTATE to the PSAP what goes into the ALI database?

First of all, we are NOT dictating what goes into the ALI database.

> Problem: When dialing 9-1-1 from the repeater autopatch, the repeater
> location shows up on the screen at the 9-1-1 center, which could
> POSSIBLY (not likely) confuse the operator.

Agreed. This can be a potential problem. The information is, though, generally useless, so there is not point in putting it up. However the computers are capable of associating other general data with any phone number. The phone company provides the information it has, but the 911 system administration can add whatever they want (that they have disk space for).

> The solution is to eliminate the ALI (Automatic Location Identification).

Better yet, for these phone numbers, REPLACE the normal ALI information with special instructions. Those instructions could read:

> This call originates from an amateur radio repeater.
>
> Use simple radio protocol; this is not cellular.
>
> ALI data would not be applicable for mobile stations.

> So our repeater group programs the repeater controller so that it dials
> a 7 digit number that comes in on the same 9-1-1 lines, but with no
> ALI.

That's better than giving the dispatcher potentially misleading data.

> The solution works, and everyone is happy.

Are they REALLY happy. Do the 911 system administration people really know you are doing this? These are the people who did not respond, right?

> Now Mr. Stark Raving Ham is PISSED OFF, because....well, no one's
> really sure WHY he's upset...he just usually is.
>
> This guy actually sent me mail, saying he USED to think Seattle
> was an OK place before he read rec.ham-radio and found out what
> a LOUSY 9-1-1 system it has!

NO!! *I* was the one that sent you that mail.

And I did NOT say it had a lousy 911 system, I said it was mismanaged. You responded by e-mail saying I was upset because they did not do it MY WAY. But this is not correct. I believe that system is mismanaged because your inquiry concerning the ALI database was NOT RESPONDED TO.

Had they responded, and declined to change the database, then at least they were in a position to know what was going on and decide what best fits into their system. What they did instead was choose to keep themselves ignorant and encourage you to do what you felt best to improve the situation. I do NOT disagree with what you did. But I believe the central administration problems go beyond simply making decision that happen to be different than you or I would have made.

> I'm sure glad he's not in our repeater group. I can just see him
> calling the media when things don't go his way.

It's not a case of it not being "my way". I don't call the media for that reason. I call the media when something is definitely wrong and the normal channels of clearing it up fail to do so after a reasonable degree of effort. We call it "whistle blowing".

I'm glad you don't run the media.

You're not just whistling Dixie! ;-)

> What if the guy wants to do repeater offsets to operate on RCC
> frequencies in an emergency, to telephone (via radio) the police?

Good question. If you're gonna do that, wouldn't it be easier just to set up the radio on a simplex Public Safety frequency and call the dispatcher direct? Ma Bell may actually take an even dimmer view

of unauthorized transmitters on her channels because you would be
costing her some revenue.

Any RCC/IMTS experts on here? Does the telco equipment allow "unregistered" mobiles with no phone number assigned to place calls through the mobile phone equipment? Maybe the idea of using RCC channels in an emergency is technically unfeasible.

I don't know how widespread the problem really is, but in the communities surrounding me there is a serious shortage of volunteers. This creates a "seller's market" for volunteer services and the people who volunteer can (and some do) say "you can't make me do that or I won't volunteer any more." We're talking about fire and EMS personnel here, so mandated minimum standards are appropriate.

In the strictest sense, no it is not a loophole. I also will not deny the existence of rules that cover the situation. But I know hams who do not have the judgment or self-discipline NOT to transmit where they don't belong. They should not have the capability.

      I see.  I guess what I was thinking of is more along the lines
of "auxiliary" operation, which (I think) must be done on a different
band from the main transmission.  There are restrictions in the rules
as to who may engage in auxiliary operation.

The way I approach problems, projects, and such (greatly based on my experience as a systems programmer) is the modular approach.

I don't want to be a complete appliance operator, but for the time being that is what I am, and it is between 144 MHz and 450 MHz.

I don't care to design and build circuits at the discrete level, either, at least not yet.

What I would like to see on the market are modular building blocks of complete modules that can be used to operate on VHF/UHF/SHF/EHF bands. A transverter, and some of the subcomponents of transverters, are now on the market, and these constitute are partial solution.

Additional modules are still needed. There need to be modulator modules to get your voice, data, or video, into an emission mode of one type or another. Modules of different emission types should all output the same I.F. frequency at the same power level.

Mixer modules (some are available now) would allow converting the signal up or down as desired. Modules should be available for output or input for every ham band that they can be made for. The power levels should also be consistent. It may be necessary that a different line be used for receive and transmit applications (due to power levels, etc.).

The modules should be as small as practical, totally sealed the best possible, or such totally sealing be available. Some should also be designed for outdoor use, or at least make a system container that can be (even with a heater).

Connector types should be consistent for a given frequency range. My personal opinion rules out UHF/SO239/PL259 type connectors above 30 MHz. BNC should not be used above 1300 MHz and 450 MHz might be a more practical limit. Up to 3500 MHz the TNC can be used. The N connectors are good for a wide range. SMA are also very good to use, but are not needed below 900 MHz. I'd be quite happy with N from 50 MHz to 5925 MHz.

PA modules should be made for a range of power levels. There are plenty on the market now for up to 450 MHz. Higher ranges are needed.

Antennas need to be marketed for those of us with no machine shops. I'd like to see some commerical yagi, helical and/or parbolic dish antennas for all the microwave ham bands. For bands that can use waveguide feeds, such antennas should be made as well as PA units that can be directly attached.

I guess that's asking too much.

QSY-ing back down to VHF/UHF.

> to understand it.

I didn't. I won't blame that on Jay, though. I can be pretty dense when I want to be. ;-)

> The real question is when is it justified to violate the OTHER rules as

I'll take Door #2, Monty. Yes, there are operators who will and do transmit with their ham equipment on non-ham frequencies during non emergency situations. Some of them are chatting with their friends who are legitimate users of the service on commercial gear.

> There are levels of "emergency" involved here. Passing health and welfare
> traffic in and out of an disaster area would count as a low level of emergency
> and is well within what the B&P rules are about. These are the things we do
> *AS* hams.

I don't see RACES' function as H&W traffic handler. I was referring to actual emergency "tactical" traffic in direct support of

Public Safety and relief agencies. Even when working with the fire department, we don't transmit on fire frequencies AS HAMS. They can certainly provide us with fire portables if they feel it's necessary. They can also provide CBers, other volunteers and the average person in the street who doesn't know what a PTT is with a radio if they so desire.

Usually, however, the served agencies do not want the ham communicators on their agency channels.

> *NOT* because I am a ham; I'd do it if I was not a ham. The
> radio happens
> to be there because I am a ham. I would also cite amateur rules after the
> fact when responding to agencies about the matter.

You might have less trouble with the FCC if you cited the other emergency rules and left Part 97 out of it. I would rather say that I used an available police radio as a concerned citizen than as a ham transmitting out of band.

That is only my opinion, however. I am not a communications lawyer or FCC investigator. It might be an interesting question to pose to someone who is.

> I've read both positions, and it still seems to me that you are not
> exactly arguing the same points. This is usually when discussion and
> debate turn into arguments and flame.

Having looked over the entire thread, including your comments, I suspect that you (and Jay) may be right about that. Perhaps if Jay feels up to continuing this discussion a bit further, he might be persuaded to enumerate the issues that are pertinent. That might focus the discussion a bit better.

I got to watch my colleagues deal with the Morris Internet Worm incident (while I was monitoring Bitnet closely at the time before we knew what was really happening). I also read the newspaper and watched the TV about the situation. The media just got SO MANY things ABSOLUTELY WRONG or at best GROSSLY OUT OF CONTEXT. I do believe much of it was due to their neglect and ignorance, and their urge to get the story out before double and triple checking their understanding of what is told to them.

There have been a few cases where I get to see the media deal with an issue I know a lot about. ABSOLUTELY EVERY time, they got things wrong and/or out of context.

From that day on, I have always questioned what I read, hear, or see, in the media.

There have been a few exceptions. I generally found the Christian Science Monitor and the Wall Street Journal to be both more accurate and quite thorough at times. I just wish the Christian Science Monitor was back in the form that they earned their reputation.

> By the way I support the no code licence as long as the CW bands don't change
> so that we can still have our kind of fun. [a possibly lame attempt to quell
> a flamefest :-)]

THIS supporter of a no code license ALSO supports the idea of people choosing to learn Morse Code and use it. I just believe it should be by choice, that's all.

I also agree that 5 WPM code is boring, as would be 5 WPM voice (try it).

You have not given code a chance to prove itself as being interesting and fun until you have learned it at a high enough speed to really do some communicating. Try for 25 to 30 WPM.

Hello.

I'm posting to these groups. Not really sure where else this should go.

I'm interested in solar electricity generation. My slightly ambitious idea is to reduce the amount of power I use from the power company. Much electronic equipment exists that runs very well on 12V DC. Most of it is for cars and RVs. The necessary 12V DC can be obtained from car and trailer battery systems. The occasional 60 Hz house current used in North America can be pulled from the odd 12V DC to 110V-125V power inverter. Lower voltages can be had using NiCad batteries. What I need is a way of recharging the batteries. This would require high output solar panels, voltage regulators, and circuitry to avoid over charging of the various battery systems.

What I need is pointers to any manufacturers that might produce any of the equipment I need. I've been poking through the latest yuppie catalog from Edmund Scientific. They have some of the kind of thing I'm looking for but unfortunately they don't include any information of who makes what.

Any manufacturer info like names, addresses, phone or Fax numbers etc much appreciated. Please send any responses to my e-mail address as I'm not on any of these lists with regularity. My e-mail address is

johnson@northeastern.edu

Thanks much.

Chris Johnson

Dear net people....

Hopefully, someone can come to my rescue with problem/query.

I've been on VHF packet for a while now... using a Kenwood 731A, PK232 and a Mac. All is well.

I decided to try some HF packet, RTTY, AMTOR and the like with my TS-440S. The kenwood 731A and the 440S have identical Mic jack connections. So, my already constructed mic<-->PK-232 cable should work fine - right ?

For HF the PK-232 manual says to put the HF rig in LSB/SSB mode, apply the tones to the Mic jack (as I do in the case of VHF/Packet), enter CALibrate mode on the pk-232 and adjust the Mic-gain on the HF rig for an on-scale ALC reading.

Simple enough. But, something appears very wrong in that I get a very erratic reading on the ALC meter. I would assume that a pure tone as is being generated by the pk-232 (mark or space) would produce a stable ALC meter reading. I did all this through a dummy load (of course) and also see that the power out (watts) is very erratic - following the ALC meter reading.

If I had to guess it would seem that the pk-232 is over-driving the Mic input to the point of distortion. But, there is no adjustment of the AFSK output level that I make that gets rid of this erratic ALC meter reading.

Again, the VHF packet works fine. I can monitor solid tones in

CALibrate mode. No problem with the drive level on the FM rig and I would assume that I can use the same drive level for HF as I do for VHF/FM packet (as this adjustment is critical for FM). That is, get the pk-232 AFSK drive level set for FM/packet then use the Mic gain control for when I switch to HF/SSB.

Whew. How can something so simple get so complicated.

Plenty of people out there must have TS-440S rigs (successfully) hooked up to PK-232s.

So, whats the story on these erratic "warbling" ALC meter readings when in PK-232 CALibrate mode ??? Not normal right ?

I know I should be using the ACC 2 jack on the Kenwood rig. And, I am having a cable made according to the specs in the pk-232 appendix for kenwood radios (so I hope their right about the connections).

In any case, the Mic input should work. And it will be just my (bad) luck that when using the ACC 2 jack I get the same thing.

Anyone got an insight into these erratic ALC readings I'm seeing ?

Thanks
Gary

I have used the Cushcraft and KLM antennas. The KLM antennas are much better and much more expensive. The Cushcraft antennas simply do not work right when they are wet. Even a heavy dew seems to detune them. The KLM antennas are very nicely built and work fine even with a light coat of ice on them. I haven't used the Hygain antennas, but a friend of mine is impressed with them. The U110 will barely swing the Cushcraft antennas if you balance them carefully. The KLMs are too long and heavy for the U110 to handle reliably. I used the Kenpro KR500 until recently when I changed to the dual axis 5400b system from Yaesu/Kenpro. I swing a KLM22C, a KLM40CX, and a pair of loop yagis from Down East Microwave for 1.2 and 2 Ghz. You really do want the ability to switch polarization from the operating point since apparent polarization changes during an orbital pass due to the changing geometry of the path. Make sure your feedlines exit the rear of the beams and swings free down to your preamp box. Routing the feedline along the boom to the mast will disrupt the antenna's pattern and make it difficult to boresight more than one antenna to the same point in the sky.

I am using CUE-DEE's 15 el cross yagi (made in Sweden). The CUE-DEES are
the only commercial ham antennas I know which can last several finnish
winters. They make also 10 el for 2m, 20 and 23 el for 70cm.
Homemade helix is also a good alternative for 70 cm (sense swiching is
pretty difficult though...).

Kaj OH6EH/2

PS. I am only a happy customer of CUE-DEE etc...

 >> What if the guy wants to do repeater offsets to operate on RCC
 >> frequencies in an emergency, to telephone (via radio) the police?
 >    Any RCC/IMTS experts on here?  Does the telco equipment allow
```

>"unregistered" mobiles with no phone number assigned to place calls

IMTS is a type of AFSK system and does not use Touchtones. The mobiles all park on a channel marked with idle tone. When a mobile goes off-hook a handshake with guard tone, connect tone and seize tone takes place. Idle tone moves to another channel and the idle mobiles follow it. The mobile then outpulses its ANI with connect tone at 20 PPS. Pulses of guard tone are sent after certain bits as a parity check for the ANI. After getting dial tone, dialing is accomplished by outpulsing connect tone with guard tone on off normal. The disconnect burst contains disconnect and guard tones.

RCC systems often use a system called SECODE. It's similar to IMTS but not compatible. Both systems have stringent timing requirements and require full duplex operation. There are more system variations than you can shake a stick at. At the bottom rung are SMR operators that use interconnects similar to autopatches. Each user is identified by a different PL tone. I think maybe the full-duplex systems are harder to dink around with than you may have thought. All of this info is published.

Here's some food for thought.. fire departments and ambulance crews
deal with emergencies all the time. Their purpose is dealing with
emergencies. Emergencies are routine. Does that mean they can
routinely use ham frequencies & repeaters without even a ham
license? The rules say no, but HEY! its an emergency!

If you have radios, you can gather your own news and form your own
opinions. The news media would rather sell those to you. I predict

that CBS et al will form an unholy alliance with the government in
which they will support anti-radio legislation in return for exemption
from it.

recent posting on rec.humor:

Q: Why is television called a medium?
A: Because it's neither rare nor well done.

I'm looking for a MARS affiliate station in the Sacramento area. Just now, a lady in CA called the GA Tech club phone and asked about contacting Saudi Arabia via amateur radio. I explained to her what MARS was and told her I would try to help her locate someone.

Is it possible to initiate a contact from this side? Or does it have to be initiated from the military station overseas? Anyway, if someone would be willing to help this lady, I would appreciate it if you would contact me.

Thanks and 73

Some interesting issues have been brought up on the net recently about antenna restrictions. Now that fewer and fewer people own their own homes, and that most of these new homes are condos and townhouses, amateur radio is increasingly threatened with anti-ham rules from CC&Rs and city ordinances. These include antenna restrictions and even rules prohibiting radio transmitters.

I have a couple of questions for those of you out there who have experience in this area:

1. I have heard that recently all city ordinances involving TVI were declared unconstitutional, as this is the exclusive juristiction of the FCC.

Can an apartment complex or homeowners association ban the use of ham radio transmitters?

2. Can homeowners associations ban antennas, or place height restrictions on antennas? Can city governments go the same? I assume that height restrictions are OK.

3. What can hams do to fight against such rules?

>guess who is going to lose - REAL QUICK!!!

This is another example of how new technology forces us to re-think our constitutional rights. There are very good arguments on both sides. The last I heard, the ACLU was siding with those who want restrictions placed on scanners, a position that surprised me. The "rights" of cordless phone users are clearly at odds with the "rights" of scanner enthusiasts.

My opinion is that everyone does indeed have a "personal space" which must be protected. HOWEVER, when you transmit a radio signal, you are sending that signal well beyond your "personal space." If your RF signal goes into MY "personal space", then I have the right to monitor it. To deny me that right is to invade MY privacy. I don't have the right to break into someone's home and listen to their phone conversations, but I should have the right to receive a signal that they are transmitting into MY home.

Think about it ... If monitoring cordless phones is illegal, then what we are saying is that the cordless phone user "owns" the signal. If he "owns" the signal, then he in fact "owns" a part of my "personal space", since his signal is there. I just don't like that idea. If the signal is in MY home, in MY room, surrounding MY body, then I should "own" it. Restricting radio receivers based on the "privacy" argument would establish a dangerous legal precedent that in the long run would harm our privacy rights. The public needs to be educated on this issue, and an un-biased report from CBS is a good place to start.

It should be noted that authoritarian regimes tend to place restrictions on radio receivers. It's pretty dangerous to have all that free-thought being picked up by the masses. Laws against radio receivers are censorship, plain and simple.

The SOLUTION to this problem is NOT to outlaw scanners. The solution is to digitally encrypt the signal, just like some police departments are doing. I know that this would increase the cost of cordless phones, but this is the only real way of guaranteeing the privacy of conversions on them. Even if scanners are made illegal, a clever kid could always modify his Radio Shack 49 MHz walkie-talkie to pick up baby monitors.

I think he is at least a tech by now. When I was in Maine last month
I worked someone on the Camden repeater who had talked 2 m to Cronkite.

A local ham (without net access) is in need of a schematic for a radio sold by Montgomery Ward (sp?) as the "Airline TRF". All I know about the radio is that it uses 201A's.

Send all replies via e-mail. Thanx in advance.

Well said Phil.

If I remember right, below 15 WPM I felt that I was in the early part of a learning curve. At that stage you have no idea what it will be like later on when you are "fluent" in the new language you are learning. Almost all of your effort is spent just getting the right sounds out and correcting mistakes. At this stage you are completely dependant on writing down letter by letter everything you hear. A most painful stage where you have to have "faith" that it will all be worth the effort.

At about 15 WPM I began to feel "competent" in my new language. I could think more about what I wanted to say and less about the mind/hand coordination necessary to communicate. I could now have a reasonable conversation with someone in an acceptable amount of time. At this stage, also, I felt that I knew what it was going to be like when the whole process became automatic: the stage of fluency. Here it begins to be "fun" and more spontaneous and less faith is needed to continue. At this stage, however I was still dependant on writing down on paper much of what I was copying but I began to read by ear many of the most common words and could see that doing away with the pencil completely was going to be the final breakthrough.

That breakthrough happend at about 20 WPM and it seemed to come quickly. I think it took only a month or so to go from 15 to 20 WPM. I think this stage comes more quickly because you have the all the basic mind/hand reflexes in place at 15 WPM and getting faster is now a matter of "burning in" what is already there. All of a sudden I could copy everything in my head and remember it all well enough to "converse" back and forth with someone in a real exchange. At this point the key (iambic) is a joy to use and becomes an extension of your mind as you push out what you want to say with fluid hand motions.

At that point I thought I was a real CW "hot-dogger" and had nothing more to learn so I was surprised to find that at about 30 WPM there was another stage. Here the key seems to disappear and you really "talk" in a new language. Now there is no difference to me whether I work SSB or CW. Often I can't remember whether a QSO I had last night with someone was on the mic or the key. I have to look in the log. Here you flip between modes without thinking about it and it dosen't really matter.

I would say that this is really the stage of fluency but now I wonder if there is another stage at 40 WPM.......50 WPM......Ah another frontier.

I wonder what it's like to play chess with a 2800 rating? Only Gary knows....

>W1AW was just extensively (and expensively) renovated and operates
>using top-line commercial-grade radio and computer equipment.

The ARRL bought Harris RF-3200 HF radios for W1AW. The 3200 is a new
design at the <bottom> of the Harris line. They sell for about $3500,
which is near the top of the "ham" HF price range. Some of their logic was
that Harris is not likely to drop the radio after 2 years and create a
spare parts "vacuum".

I have spent a good deal of time working on and supporting MUD's (Multi
User Dungeons) Although the term 'Dungeon' can be misleading, the idea is
that a MUD is a multiuser game like the text adventures in which players

can interact with each other.

I would be very interested in working on a multi-user game under packet.
I am a licensed ham, but I am not (yet) on packet.

If someone would like to work on this I would be glad to contribute my
expertise in multiuser games if someone would like to help me with the
packet radio aspects.

I can be reached by mail at cmoore@hprmokg.hp.com.

>The point here is, that the latter charges were dropped - or at least
>they tried to get them dropped - on the basis of the fact that radio

We should be thankful that, with the exception of a few states, ownership of equipment is not restricted. It's a question of *use*, not ownership, of equipment that is regulated in the U.S.

>the modified IC-2GE would be a mere subject of his construction
>project... Remember, ham gear don't have to be type approved, if it is
>not meant to be sold.

In the U.S., Ham gear does not require type acceptance, whether it is to be sold or not. This assumes, of course, that the equipment will *only* be used in the amateur service. The flip side is that Ham gear cannot legally be used on any service that requires type-accepted equipment (and that includes, for example, Citizens Band) unless it has received type-acceptance for that service.

So what this tells me is that in the U.S. (1) you won't be in trouble for owning a radio that can be used in any particular service; (2) you *might* get in trouble with a police department for any of a variety of technical points if you tried to talk on their frequencies; and (3) you *probably would* get in trouble with the FCC for operating equipment in a service for which it was not type-accepted, if you used your ham gear to chat on police frequencies.

]Then it ain't "automatic".

No, but a phone patch does handle 3rd party traffic, requiring
a control operator. However, I believe that a patch is legal if,
when the control operator is not present, only 911 or equivalent
can be dialed. This is on the theory that a 911 call is a presumed
emergency and hence the third party traffic rule is waived.

jerry@altos86.Altos.COM (Jerry Gardner NJ6A) complains (I think):

>>Obviously, he means W1AW, which, for most intents and purposes, IS a
>>shortwave broadcast station that happens to broadcast on ham frequencies
>>using paid operators.

Well, the last time I heard W1AW it was being operated by netperson
Jim Reisert AD1C, and I had a nice cw chat with him. I'm pretty sure
he wasn't paid anything to do that, he even had to write out all the
QSL cards himself.

There sure are a lot of complainers on this 'ere net - if some of you
spent as much time reading the license manuals and listening to CW as
you do complaining about things here, you'd all be Extra class ops by
now (no offense intended to original poster, who obviously has time to
do both!).   [add appropriate fraction of a :-)]

The good news is that the ARRL offers a group liability policy in addition to
the better known equipment policy. The bad news is it will cost you around
$500/year. The same agency (Woehlers, I think) and carrier (CIGNA) are used
for both policies. Contact the ARRL for details.

you might find it hard to argue against. I wonder how many hams who
use CW now would have avoided the CW test if that were an option.

>Anyone out there have any information, descriptions, reviews or comments on the
>ICOM's R1 and R100.

I have an R-1. Here is a very brief review:

Convenience, size - excellent
Ergonomics, features - very good
Sensitivity (25-900 mHz) - good to very good
Selectivity - good to poor

The biggest performance problem is the tendency to pick up images of strong
signals exactly 150 or 300 kHz away from the signal you're trying to hear.

PS: It is now with me ALL THE TIME, faults and all.

This notice was posted on the Voice of America "HamNews" Bulletin Board

----

___DEX, THE K3EKA SECRETARY, OPERATING 4U1ITU IN GENEVA

The secretary of the VOA Amateur Radio Club, Dexter Anderson, is in Geneva and he is operating the ITU Club Station, 4U1ITU.

For all you DXers, 4U1ITU is considered a separate country for DXCC purposes.

Dex plans to operate on 10 meters USB on frequencies between 28.400 MHz and 28.416 MHz on October 10, 11 and 12 between 12:30 PM and 1:30 PM EDT.

Sorry for the late notice. Good luck!!

The same one that cellular calls are routed to. Does your system just route
cellular calls to a random/arbitrary jurisdiction? Cells don't align with
the jurisdictions unless we have solved some problems in the physics of
radio waves I have not heard of.

What 7 digit equivalent? Where does it go to?

It definitely sounds like there is a management problem there. Maybe you
could get better response through the local TV media. They eat stories
like that for lunch.

* 97.403 Safety of life and protection of property.
*
* No provision of these rules prevents the use by an amateur station of
* any means of radiocommunication at its disposal to provide essential
* communication needs in the connection with the immediate safety of human
* life and immediate protection of property when normal communication
* systems are not available.

As I read this rule, it tells me that my amateur station (and it remains
in the amateur service) is not prevented by other rules (such as limits
on frequency or power) for radio communications under specific circumstances
it mentions.

So my radio is not type-accepted. It does not need to be type-accepted in
order to EXIST. That requirement applies to use in the Land Mobile service.
If it is there, it falls under "any means of radiocommunication". If the
other "normal communication systems" are not available (e.g. no cellphone
here, and no repeater locally that has an autopatch), that that fits another
requirement. Of course there must be a real emergency, too.

Another thing to try, and this might also add evidence to your case against
a particular VE or VEC, is get tested by another VE/VEC. Not all of them
are bad.

You're probably right.

> BUT... any equipment used on police or other non-amateur
> frequencies MUST BE type accepted. Using modified ham gear outside
> the ham bands is ILLEGAL, no matter how many public-spirited EMTs and
> others are carrying them on their belts.

Right again. But mere OWNING or CARRYING such radio is not a violation. And the regulations (I guess that is a law, even), state that in case of emergency etc. every citizen is REQUIRED to do anything that can be done (with the exception of putting oneself in great danger) to save a human live or considerable amount of public or private property.

Your bias may be different. To us, people's lives come first, not the rules.

Luru

BZZZT! Wrong answer. Commercially produced HF linear amps have to be type accepted. The odd criterion for acceptance is that it can't work on 10 meters, or be easily adapted for 10 meters.   Too many 10 meter amps were ending up on 11 meters.

"Easily modified" seems like a fuzzy term. I think it refers to amps whose instructions might read:

"Warning! To maintain type acceptance, do NOT remove the bright orange tab on the bandswitch that prevents rotation to the 10/11 meter position!"

Hams can still build their own amps without type acceptance, but not more than one per year. They are also free to modify the "not easily modified" amp to run on 10 meters, but that may count towards their annual quota.

>It is quite fun to build your own QRP CW rig. I built a "Tuna Tin 2"
>from the ARRL's "Weekend Projects" book and had a lot of fun with it.

I've looked at this project on and off for quite a while (since the original article was printed, in fact). However, this rig (and several other old projects from the mid- to late-70's) uses a Radio Shack choke that stopped being available almost as soon as the article appeared (either the 10 uH or 100 uH choke, I forget which one; one of these is still available (or was a few months ago). Since all of these articles give modifications in terms of number of turns (and not resulting inductances), the construction info works only for these specific parts.

Does anyone have information on the resulting inductances, or another source (name, part number) for the same parts?

Note that this sort of thing is encouraged (or at least allowed) between
certain agencies.

One example that I know of in NYC where

1) NYC-EMS radio's are equipped with the police frequencies for the surrounding areas (the new sabers are equipped with the entire city)
2) EMS units that do not have police bands on their radios can go to the local police station and sign out a radio.
3) NON-OFFICIAL AMBULANCES (such as volunteers) can go to the station and sign out radios.

This provides for a faster response to most ambulance calls (as with the exception of during police emergencies, where no other calls are put out, the police dispatchers are always ahead of the EMS dispatchers) and also allows for quick multiple agency notification in case things get hairy.

The units are generally identified as just "EMS" on the air, with no specific unit mentioned. This is generally true of the Volunteers also.

Another possible way to get intouch with the dispatcher is to use the notation "XXX Portable" where XXX is the police precinct where the event is happening (assuming you are on the correct frequency).

While the above methods do work, they are not really intended for civillian use.

So what is the legality of amateur television on the 70cm band under the
new Canadian licensing and regulations? Do they still require you get a
special permit, or has that been removed now or before?

IMHO it is arguments like this that blow all the credibility that the
PRO CW proponents have (and it isn't much to begin with.) Comparing
writing down the dots and dashes to trying to get a car with bald tires
inspected is just another case of apples and oranges.

How about comparing to an inspection station that says "I won't pass
your car unless it comes thru my doors with the manufacturers paper
stickers still in place on the the tread on all four tires. I don't
care if you just bought them yesterday." I would think you wouldn't
stand for that for a minute. But arbitrary and capricous behavior on
the part of a VE is OK??

I was just playing with a new toy our department bought for cable and line analysis, and I think it's got some real possibilities for amateur use. It's called a Cable Scanner, and it's designed for monitoring and analyzing ethernet, 3270, twisted pair, TV cable and other transmission line systems. While it has a number of functions, the one of interest is its built in TDR function. Playing around with a few spools of thin ethernet and 72 ohm coax, I discovered that the box can accurately locate shorts and open lines; it may even be able to locate impedance bumps; I don't know, as I didn't have the manual.

At $1595 (Inmac list price) it's a bit hefty, but hey, hams have been known to spend that on scopes. I wonder if perhaps there are cheaper models of this sort of box available?

I am interested in getting involved with Ham operation.
If any one out there has any information on materials available in braille
I would appreciate it very much if you could let me know.
I know that there are audio tapes out there with some of
the information and would also apreciate any recomendations of these.

Thanks in advance.

I don't follow this part. All radio transmissions in a Public Safety system should be taped. I am not aware of any agency in my local area that does not tape radio traffic. Do policies on this differ in other areas?

I could use some suggestions, comments, or advice.
Does my dream radio system exist?

I am totally blind and happen to be an avid skydiver.
One of the major problems I have encountered over the years has been
with radio systems. I am currently using a police scanner type set up belonging
to the
drop-zone where I jump, but would like to invest in my own gear.

The ideal system would be something like this;
It would have to be somewhat protable, able to be worne inside
a jumpsuit, mounted on the parachute harness across my stomach, or
mounted directly to my crash helmet. As far a size goes, remember that some
jumpers jump with

jumpers jump with video cameras mounted to their helmets.
The radio should be two-way with a voice activated mike
and a speaker that could be mounted inside the helmet.
The mike would have to be able to cancel wind-noise up to about
30mph, this is only to be used once my canopy is opened.
I do not think a freefall system is possible.
The range would have to be no less than 2.5 miles.
And most importantly, it must be very reliable. I have already found myself
several times, under canopy at 2,500ft with no communication
with my ground suport.

Please send any suggestions or information to me here.

Thanks
Dan Rossi

> I hate to ruin your day, Stark, but ICOM purposefully designs radios so that a simple mod will allow transmission outside the ham bands. There's money in it, so they do it. My friends and I buy them because of it.

Are you a licensed ham? Does ICOM have any business selling transmitters to you and your friends? Not that they care. You hit the nail on the head when you said "there's money in it, so they do it."

I have always been against the policy that "every volunteer needs a portable." There are a lot of non-licensed EMTs and vollie firefighters running around with modified ham portables on Public Safety frequencies. They and their illegal radios do not belong on the air. I always thought a firefighter's job was to put out fires, not to jabber on his portable radio.

Now we have the folks in this echo claiming that hams should be able to transmit on police channels so they can call for help. That is what telephones, repeater autopatches, fire alarm pull boxes, etc are for. Civilians do not belong on the police radio, therefore they do not need access to equipment that will transmit there.

> Rich Bono, if you are reading, THIS is the kinda guy I was talking about.

For your friend's benefit, THIS kinda guy has extensive Public Safety emergency communications _and_ disaster preparedness experience. The only way the system works under normal or emergency conditions is if everybody stays where they belong.

I got my novice in 1957 as KN4RMT and upgraded to K4RMT 9 months later. In the early seventies I lived in Maryland and applied for a change of call: I got W3GRG - obviously the calls in 3-land went slower than in 4-land. Now, back in the South, my W3 is rather unique, but I would still kill to get K4RMT back - sure wish I had kept it (it was never reissued). Sigh.

Way back then, if you had been licensed for 25 years and had an Extra-class, you could apply for a 1x2 call. How did you get K6ZH at your tender age?

> Gosh--here I am at age 42 and I can join QCWA! A sobering
> thought....

Gee, I'm 48 and licensed for 33 years. Should I join QCWA? What's it do?

Steve - W3GRG

|>weighs the interference. I do too, even though I still think it sets a
|>bad example of poor operating practice.
|>

Likewise, the FCC agrees that the service is legal. In fact, I recall that the FCC has often affirmed that the ARRL is on solid ground by running their transmissions and has even opined that people who run "right of navigation exercises" by transmitting on top of the W1AW bullens/code practice are subject to being cited for bad operating practices. Their reasoning was that the ARRL is recognized internationally as the "national radio society" for the US and that the W1AW schedule is very well publicized.

Yeah! Like when you're getting your car inspected, and your bald tires won't pass. Just keep going until you find an inspection station that will pass it. :-)

73   Dube   N5PDK

PS: Has anyone successfully sued an inspection station for failing their car???

****
*** GEOMAGNETIC STORM ALERT ***
****

Issued: 23:45 UT, 10 October

Attention:

At approximately 23:57 UT on 09 October, a sudden magnetic impulse (characteristic SSC-type signature) was observed at the magnetic observatory near the University of Lethbridge. At approximately 02:20 UT on 10 October, a Minor Storm level positive magnetic excursion occurred locally. The magnetic field has since been fluctuating at Active to Very Active levels and it is believed that at least Minor Storm level fluctuations may begin at any time. It is not known whether the main phase of the storm has yet begun (or if it will materialize at all), although it is anticipated anytime now. The potential storm intensity is not expected to exceed Minor Storm levels at low and mid latitudes, however activity at higher latitudes (and possibly northern middle latitudes) could reach Major Storm levels over the next 12 to 24 hours if the storm reaches maturity.

Radio propagation conditions are expected to be Very Poor over high latitude paths. Paths particularly susceptible will be those which pass through or near the auroral zone, which may shift southward over the period due to the storm conditions. Southern middle latitudes and low latitudes should maintain Fair to Good propagation conditions throughout the period, provided this activity does not exceed anticipated levels. Fading will be more pronounced on most HF frequencies and may be quite severe over high latitude paths. High latitude paths can also expect increased signal absorption due to auroral activity. Some auroral propagation may be possible over higher latitudes where auroral activity is more pronounced.

Auroral activity will reach High levels over high latitude paths and will be visible from northerly middle latitude locations. Mostly moderate activity should prevail at middle latitude locations. Low latitudes will, unfortunately be unable to witness the auroral activity unless storm levels become significantly more severe than currently anticipated. An additional alert will be posted if activity exceeds levels currently anticipated.

The following forecast charts have been modified to reflect the recent increased geomagnetic and auroral activity:

REVISED FORECAST OF GEOMAGNETIC ACTIVITY

NOTES:

x = Actual auroral activity which occurred over the past several days. Sunday on the chart represents 07 October.

* = Predicted auroral activity for the remainder of the period.

SUMMARY OF ACTIVITY TO 05:50 UT ON 10 OCTOBER

The geomagnetic field continues to fluctuate at Active levels, interspersed with periods of Unsettled activity. It is possible this activity may only be momentary and may not attain a storm classification. However, it is still believed that the geomagnetic field will maintain Active to Very Active conditions with sporatic bursts of Minor Storming. If this activity should materialize into a full fledged major event, an additional alert will be posted.

Please send any reports of degraded radio conditions as well as sightings of auroral activity to the address below. Please include a brief description of the type of conditions observed, your location (approximate latitude/longitude) and the time of the observation(s) in Universal Time.

If reporting degraded radio propagation conditions, please specify the path(s) attempted and the type of interference encountered (ie. strong fading, complete blackout, rapid fading, strong noise, strong signals, etc).

If reporting auroral sightings, please attempt to describe the type of auroral activity observed, it's dominant location in the sky, and approximately how bright the auroral activity was as well as anything else noteworthy (ie. visible pulsations, color fluctuations, etc.). If reporting auroral sightings, it would also be appreciated if you could state the local time that the observations were made, as well as the Universal Time of the observation.

ALSO, if any of you experience local power outages which you can be relatively sure were not caused by thunderstorms, PLEASE report them with information regarding the length of the outage, whether it was only momentary (ie. a few seconds) as well as the time of the event in both local time and Universal Time.

All reports will be used to improve forecast accuracy. Reports will also be used in impact analysis research which will also aid in improving forecasts. To all those who send in reports, thanks very much!

Send all reports to: std_oler@hg.uleth.ca

```

>points out, there is no reason they can't; they're just not scheduled for it.
>All the voice contacts we know about will be by sked, and that is not
>brain-dead, it's just their choice.

1. Please stop taking me out of context and mixing quotes, Patrick. I never said that the current arrangement is "brain dead". In fact, I think that reserving slots for the schoolkids is a very good idea.

2. Ron will indeed be taking calls from "J. Random Ham", but only as time permits. In any event, chances are you'll wind up with the robot.

3. My only substantial grievance here is that the slot allocations were not publicized, to allow the rest of us to schedule around them.

As to voice-activated microphones, we hang gliding folks have tried out a lot of different 2-meter radios in the past few years, and the only VOX that is not oversensitive to wind noise is the Yaesu brand voice-activated microphone. We're dealing with wind speeds from 20 to 40 miles an hour or so.

It may be simpler to use a push-to-talk switch.

You can mix brands, the VOX or PTT does not necessarily have to be the same brand as your radio. Make sure they work together of course!

Does anyone know of any satellite tracking software for the Mac family? I never see any in the periodicals and haven't heard of any. While I'm posting this I would be interested in any radio related software for the Mac.

Thanks,

I was concerned to read the postings about our new licensing structure.

The following information was obtained from our Department of Communications enforcement officer today:

1. NO PERMIT WILL BE NEEDED BY US AMATEURS TO OPERATE IN CANADA although other foreign hams will need a permit rather than simply a letter of

authorization as is now the case.

2. The deregulation of the subbands has been planned for many months as part of their plan to achieve more amateur self regulation.

3. Basic licensees will not be able to use commercial equipment modified for the ham bands. However, since commercial gear is very expensive, this shouldn't be too big a deal. It would just mean going for a higher level of license if it was important.

4. The question of POSSESSING either more powerful equipment or equipment that will transmit outside of the ham bands remains unchanged. They are not concerned unless you TRANSMIT with it. Besides, they have more serious problems that looking for hams with this type of equipment and will only be concerned if there is a complaint.

5. Tower approval will have to be sought from local authorities but this does not have to be a permit or license unless the municipality so designates. They are looking for more responsibility from radio operators to ensure that antenna supporting structures are reasonable

in appearance as well as technically sound.

Hopefully this helps to clarify some of the points and presents a more positive view of what (generally speaking) is an excellent improvement for the amateur community.

I just picked up a brand new Alinco DR-590T and have had some problems that I would like to share with you all out there in ham-net land. Maybe someone out there can help me with a couple of these problems.

1, I got this unit because of all the cool features it is supposed to have, including cross-band repeat. The instruction manual does not even mention this feature. After calling Alinco I found that this was a feature functions only after modification. They said (more than a week and a half ago) that they would send me the modification instructions. I haven't heard anything from them.

2, The Autodialer (an option for the 590E according to page 13 of the manual) did not work as in the insturctions. Another call to Alinco and I found that it is also an option in the 590T. On page 19 it was pointed out to me is a note to this effect. These instructions are also unclear. Anyway I went out and purchased the required DTMF unit and installed it. Now I can store the numbers in the autodialer's memories, however I cannot get the rig to autodial any number except the number stored in memory #1. I have tried every possible interpretation of the directions on page 13 of the manual and had no success. Another call to Alinco . . . they told me that they knew that the manual was written in jinglish (japanese/english) and was hard to understand. They said that they would send me a complete manual written by someone who spoke english as their primary language. I asked them why this manual was not provided with the rig and they said that it was free to anyone who asked for it ?!?!

3, This rig is supposedly able to receive DTMF codes from another transmitter that will allow remote control of the rig (useful as a very flexible cross band repeater). I have not been able to get this to function on my rig at all. I can only hope that possibly the modification they promised to send me will enable this function or that the new english directions will beable to explain how to make this happen. This function is the main reason I chose this rig since it will allow me to access local repeters from my office via 440 link.

4, The remote page/DTMF squelch function are completely cryptic I hope they are also explained in the english directions.

Anyone with any mods or operation instructions for this rig please let me know. Am I the only one with these problems? Does anyone have any solutions? Is Alinco always this slow? etc.?

I will post a summary when a solution is found
so send responses to me at my address:szarekw@lonex.radc.af.mil

As a newcomer to this newsgroup I'd like to re-ask a common question:

Wherefrom can I ftp ham-programs for PC, as QTH-locator-calculations,

list of QTHLOCS/LogLat-positions, etc etc. Computing distances between
Lat/Log or QTH-locs etc etc. ?

Sincerely yours

[Can we please dispense with the gun control debate?]

As I mentioned in a previous article, the only restrictions on
emission type under the new Canadian regulations concern signal
bandwidth. According to the DOC, the restrictions are:

```
     Bands below 30 MHz 6 KHz
     50-54 MHz     ? (Forgot to ask)
     144-148 MHz        30 KHz
     220-225 MHz        100 KHz
     430-450, 902-928 MHz   12 MHz
     1.2 GHz and up         Unlimited (you do have to stay inside
                   the amateur allocation, though :-)
```

Just wondering: Just what is involved in getting a radio "type accepted" anyway? Design it to meet some design rules, like the user can't make it transmit out of band or too much power? Send the design, or even a sample to some FCC test lab? Or just pay an application fee? If cheap enough, and easy enough, someone could get a modified Icom u2AT type accepted. So you EMTs with them would be legal? (didn't think so..),

It sounds like they need a little more of a "kick" in the butt to enter the information. I'm not sure which 9-1-1 they've got out your way, but if it's anything like the one I work on (I'm a developer of enhanced 9-1-1 systems), it's got free-form text locations that can be linked to a particular ALI record. I would suggest that you try to bypass the phone company and find out who the administrator of the 9-1-1 system is (it's usually a separate sub-group); he (or she) should be able to manually enter ALI data with you right there on the phone. It's definitely worth the trouble.

}jerry@altos86.Altos.COM (Jerry Gardner NJ6A) complains (I think):
}--------------
}>>Obviously, he means W1AW, which, for most intents and purposes, IS a
}>>shortwave broadcast station that happens to broadcast on ham frequencies
}>>using paid operators.
}-------------

I wasn't complaining, rather, I was merely stating the facts. For the *most part*, W1AW is a broadcast station. There are times when guest operators and staff use it for two-ways, but mostly it's used for bulletin and code practice purposes. It's also a fact that the bulletin and code practice transmissions are conducted by paid operators for whom the ARRL had to get a special dispensation from the FCC.

I think W1AW does serve a useful function (I copy the CW bulletins every night) and should continue. There are those who wish, however, that the

W1AW operators would listen on their transmit frequency before cutting lose with a bulletin or code practice session. I'm not among that crowd, since the W1AW schedule is published well in advance and I *know* exactly when and where they'll come on frequency and will avoid those frequencies.

}There sure are a lot of complainers on this 'ere net - if some of you

I am trying to put together a collection of TS-940S modifications. If you have something of interest, please E-MAIL me direct. I don't want to clutter up the net with postings. I am looking for news-letters, mods, undocumented info other than whats in the Kenwood service manual. In particular, I would like information about the RS232 port, and the commands that the 940 will accept through the port.

Thanks

Not all. Some cities do indeed have ONE dispatch center. Lack of a common central dispatch office is politics, not effective system design.

It's amazing how little we seem to know about the services that operate around ours. When I saw the 6.46 Mhz split, the first thing that popped into my mind was CAP. I don't know of any other services that use wierd frequencies. I know that MARS is an odd split, but their's is about the minimum they could run and stay out of the ham bands.

On a brighter note, did anyone see the segment on phone-patching from Operation Desert Shield on CNN yesterday evening. It's about time we see a ham on the news in a good light. maybe there is hope for Amateur Radio yet.

In a recent Digest, someone (my $?%#$% terminal lashup won't let me include the relevant article from here) said that they didn't believe that individual firefighters needed handhelds.

The EMS I belonged to until recently had an ironclad policy: every member had a handheld, and they were not to respond on calls without it, ready to use. This was a safety issue: it was felt that they needed the ability to call for help immediately upon encountering a situation they couldn't handle. This policy saved numerous injuries and other problems. Many progressive fire departments are doing the same for firefighters, for many of the same reasons. You may be certain that my IC-02AT was available for backup to my EMS radio - for if I needed it, it was an emergency situation, and my EMS training taught me to look out for myself first, and damn regulations that get in the way.

I believe the original poster, who asked how to get his IC-2SAT to do a 6.46 MHz offset, may well have been trying to use his radio in one of the MARS or CAP services, which have inputs and outputs spread across the 2 meter ham band. The original flame (from the same FidoNet newbie that I'm responding to) was completely uncalled for.

Swan was bought by, taken over by or somehow became the same as Cubic Communications, Inc. Cubic continued to produce ham gear for a few years and then switched to production of "government" electronics. They still honor some requests for parts and manuals.

The TH-77 is a two band handheld. It will support cross band repeating. It will use all the current TH-25 accessories, e.g. batteries, chargers, except the cases. Advertisements should start showing up in November.

Suggested Price is $599.

> ...most anybody can learn code if they try.

Can I twist that a bit? "Most anybody can learn tree climbing if they try." Gosh, that sounds like sufficient rationale for making it a requirement for a ham license. Doesn't it? After all, any decent ham will want to climb a tree to put up an antenna.

Whoa! Many hams have no reason to climb a tree in the pursuit of the hobby. Uh... How many hams need morse code to pursue the hobby?

The issue is NOT whether it is LEARNABLE, but whether it is RELEVANT!

I find code reasonably easy to learn... and to forget if I don't use it... which I don't. I think it's a crummy licensing requirement.
It is NOT RELEVANT.

Alan, N0MFW (recently climbing trees to put up an antenna)

> locations which can take oddball splits (out of a total of 10).

The Yaesu FT411 does the same for all memory channels. It works the same way. Merely hold PTT while storing the frequency. This is useful, for instance, to store a "safe" (in-band) transmit frequency with various out-of-band receive frequencies. The display shows "-+" (both the "-" and "+" splits) to indicate the oddball situation.

Of course, you can quickly press RPT to turn off the split, same as rotating "-" / "+" / none. Dial off and back to the memory channel, and the split is restored. Nice!

Whatever else people say in derision about my "portable pinball machine radio", it has some good features like this.

EXCEPT in emergencies.  Right?

I thought the burden would be on me to prove it was a legitimate
emergency, not to prove the equipment was type-rated, which is
irrelevant in a bona-fide emergency.  Yes?

  It appears to me that alot of the 'intermod' problems with the
  latest HT's are due to the wide receive frequency range. I have
  noticed a definite difference (sorry no quantitative measurements)
  between my 'old generation' Yaesu and Icom HTs and my Kenwood TH 26.
  I attribute most of this to the extended frequency coverage of the
```

Kenwood (138 to 174 MHz). Although I have not noticed the problem
on my Kenwood TM-231 which has the same receive coverage.

Anyone have similar experiences or maybe even hard data?

My point is that the designers of HT's should be aware of the presence of
the hostile RF environment, and design their products accordingly.
It would only take a 3-pole helical filter in the front-end to push all the
pager/FM-broadcast/local-police-repeater-on-image-frequency garbage
way down into the weeds... Your local Toko dealer will sell you
very nice filters for 6 dollars one-off cost; presumably Icom, Yaesu etc,
with their purchasing leverage could get them much cheaper;
Make the radio *slightly*   bigger to fit one of these
0.7 by 0.5 by 1.2 inch filters in, if it actiually made the radio usable,
I would happily give up crossband-repeat, 20 memories and scanning if it
got the filters to fit.
Instead, i would have to fit the filter in a small project-box and hang it
on the radio with a length of coax and BNC conns....!

I need some info on 2-meter FM & CB radios for a car (to use if the car should
break along the road

I wish to install it in such a manner that it is easily removable, as my
car is broken into frequently. Perhaps I can power it off the cigarette
lighter.

1) what radio's do you recommend...where can I get good consumer ratings for
   variouse transcievers (this is particulary hard for CB radios---which
   is better, Cobra or Midland)????

2) what about antennas that can be easily removed each time I use the car.
   My car is vandalized regularly, plus, I would like to move the antennas
   to my room (maybe put them on a window sill) and use the radios indoors
   too.

I don't read this news.group regularly, so send me e-mail

Steve

seid@hyperion.ee.cornell.edu

thanks in advance.

The mod to unlock VFO will only work on radios with newer CPU. We tried it at HRO with an early model and it would not work. The one I know it works on has serial number over 010000. How does it receive AM? Beats me. But it does receive commercial aircraft transmissions 118-124 or so. Lots of other stuff on other bands if you want to take the time to search for it. What freq is cellular radio?

They are in my neck of the woods. The signals are carefully phased so that the receiver hears what sounds like only one signal without the phase distortion that would normally be caused by multipath reception.

Exactly. But we have gone from the reasonable view of being aware that you can use your transceiver (or anyone else's) outside it's normal legal operating limits in certain kinds of emergency to going out of our way to make the radio capable of being used illegally just in case such an unlikely catastrophe were to occur to us.

A lot of people, with and without ham licenses, have demonstrated a lack of self-discipline as far as not using such capabilities if they have them available when there is no emergency, or when the circumstances do not justify invoking the rule you quoted.

[rest omitted]

The salient point here is that this arrangement is by agreement between different Public Safety agencies. It does not apply to civilian radio equipment which happens to be capable of the same type of frequency coverage. The radios are owned by the City of New York, and issued either to NYC-EMS or NYPD.

I note that you made a similar point at the end of your message, so I'm not arguing with you.

My _personal_ bias is the same. However, it is demonstrably true that there are people who feel they MUST find an excuse to use those radios if they have them. If the only time a ham transceiver was used on a police channel (or fire, or EMS) was a true emergency, there would be no problem and no argument. This is just not the case here.

Your EMS agency had that policy. Fine. The EMS agencies in my area don't have such policies, especially when it comes to PRIVATE ownership of transmitters. In fact, having everybody and his brother equipped with a portable can be an extreme annoyance to central dispatch. It is also a hazard during major incidents, when only a handful of people NEED to be on the air (Triage, Command, Operations, Staging, etc. - not EVERYBODY).

> - for if I
> needed it, it was an emergency situation, and my EMS training

Fine for you. Perhaps YOUR training has taught you something of value, and perhaps YOUR sense of self-discipline will keep you off the PS bands with your ham radio during routine situations. But I invite you to visit the Rochester, NY area sometime and count the modified IC-2s and IC-02s and other rigs by other manufacturers that are being carried AND USED daily by people who are not licensed amateurs. Even the ones who have positions requiring the use of an individual radio have no business utilizing a non-type-accepted ham rig as that radio!

> I believe the original poster, who asked how to get his IC-2SAT to do a 6.46
> MHz offset, may well have been trying to use his radio in one of the MARS or

He specifically stated that he was trying to use a non-amateur repeater. People who want CAP and MARS mods usually say so.

> The original flame (from the same FidoNet newbie that I'm
> responding to) was completely uncalled for.

I disagree strongly. And I don't think 2 years in FidoNet and 7 years in Public Safety communications plus 9 years as a licensed ham qualifies me as a "newbie."

I know quite a great deal about services other than amateur radio. I admit to not thinking of CAP, but the person who made the original inquiry did not, in his first or any subsequent message, state that he had any legitimate use for the mod. If he is a CAP member, why not say so?

>1. NO PERMIT WILL BE NEEDED BY US AMATEURS TO OPERATE IN CANADA although
>other foreign hams will need a permit rather than simply a letter of

>authorization as is now the case.

Which office did you talk to? The DOC Vancouver office has a completely
different interpretation of this. (Not the first time that's happened.)

>3. Basic licensees will not be able to use commercial equipment modified
>for the ham bands. However, since commercial gear is very expensive, this
>shouldn't be too big a deal.

Are you kidding? Look at the price of a 440 MHz amateur transmitter from
Kenwood/Icom/Yaesu. Now look at the price of the 450 MHz Pye commercial
rigs we picked up for $5 each. (Yes, they work, and come with 120 V
power supplies as well.)

>4. The question of POSSESSING either more powerful equipment or equipment
that will transmit outside of the ham bands remains unchanged. They are
>not concerned unless you TRANSMIT with it. Besides, they have more serious
>problems that looking for hams with this type of equipment and will only
>be concerned if there is a complaint.

I expected a clarification on this was forthcoming. Let's hope all
the DOC offices agree with this interpretation.

As far as monitoring (or enforcement in general) goes, you have to
f*** it up pretty bad before the DOC will even begin to pay attention.
They barely have enough staff to monitor their two "priority: services:
public safety (police, fire, ambulance) and commercial broadcasting.

With all the talk of the 75S series and others, I haven't seen on mention of the 51S-1 receiver. Unfoutunately, I don't remember too much about it except that it covered 3-30 mHz with out extra crystals, had all the necessary jacks and connectors on the back for hooking up to another radio (transmitter) and as far as I was concerned at the time, one heck of a fine receiver. I used it with a monopole antenna and another Collins transmitter of URG vintage. That's a long story in and of itself. Anyhow, all this was about 10 years ago, but if I was looking for a Collins receiver, especially for full coverage use, I'd sure look for a 51S-1.

73 and Good Luck,
Michael

>> 20 transmitters all belching out 250 Watts in simulcast.
>>Wow, I had no idea ... how does this work?

>The transmitters are NOT on the same frequency.

The transmitters <are> on the same frequency for a given system. I've never known anyone to have to change digital pagers as they moved around in one continuous service area.

Our transmitters all have ovenized oscillators so that no two stations ever vary by more than 50 Hz. Some systems use disciplined oscillators linked to an outside source. That takes care of any squealing at the receivers -except for 50 Hz, which can be ignored (like PL). Each transmitter is connected to the paging terminal by a designed (non-switched) circuit. An adjustable audio delay network at each transmitter assures that they all transmit the same bits at the same time. All that is left is bit spreading at the receivers due to the arrival of 15 RF signals from different distances. That helps limit the data rate (given standard +/-5KHz deviation).

There is a <lot> of signal overlap. That is why a maintenance man in sub-basement 3 of a 50 story building still gets his page with reasonable reliability.

>or where their old parts stocks went?

I own a Swan 350C ('bought it new, still use it when I get on the air, works great).

On a local ham swap repeater, someone asked the same question. Swan was a subsidiary of the Cubic Corporation, located in San Diego, Calif. The Cubic Corporation still exists although they are primarily a defense contractor.

This info is about 9 months old but... the Cubic Corp. still supports (presumably to a limited extent) Swan equipment according to the person I spoke to on the net. Their phone number is (619) 757-7525. The person to contact is Chuck Harrell at Ext. 228. Also, a person named Grace at Ext. 243 was mentioned. The info. source was N6DW on the net.

Good luck,

You can emit whatever you bloody well please, as long as you stay
within the band edges, and within the per-band bandwidth limitations.

How is the Harris line defined? If "top of the line" means a megawatt
of output power, then it certainly wouldn't be appropriate for W1AW.

Just out of curiosity, how old was the gear they replaced? Was it
rendered unsuitable because of parts unavailability?

You can get a Swan 500CX manual for $12.25 from:

Hi Manuals
P.O. Box 802
Council Bluffs, IA 51502

They don't take personal checks or credit cards. The price includes shipping in the USA. You can get a catalog of manuals for lots of old ham gear for $2.00.

What makes you think your receiver's problem is caused by transmitted "crap"?
Intermod in your receiver is not caused by spurious emissions. And if you
have your TH215 hooked to any antenna other than the little rubber one that
came with it, the problem will be worse. Probably the paging transmitter
is putting out lots of power, but only on it's assigned frequency.

Are you SURE? How is it that the FCC restricts 10 meter coverage in
linear amplifiers (even kits!) manufactured for the amateur radio market
then, without the process of type acceptance?

RADIO AND COMPUTER EQUIPMENT AVAILABLE

MAKE ME AN OFFER ON ANY ITEM

COMPUTERS:

ALTOS ACS-8000, 4-user MP/M machine with 30 Meg HD, two 8" FDs, console, much software.

RADIO SHACK TRS-80 MODEL I, 3 FDs, OMIKRON Mapper to run unaltered CP/M software, RS-232 interface, RS monitor, tape drive, much software.

ELECTRONICS/RADIO:

Bendix WW II vintage receiver, RA-10 with remote control unit, covers 150-1100KHz, 2-10 MHz.

TS-147D/UP "Radar Test Set," appears to be a signal generator, 850 MHz to just under 1 GHz, pulsed/cw, some parameter adjustments.

COMMAND SETS:

Transmitter: 2.1-3 MHz
Transmitter: 3-4 MHz

Receiver: 3-6 MHz

If you take these, I'll throw in a working Lambda Model 50 regulated power supply, 0-500 VDC plus negative bias and filament supplies, all in one cabinet.

PHOTOGRAPHIC:

GAF autofocus slide projector with cabled remote (compatible with older Sears, Wards, Argus, etc, etc) and many, many slide trays (don't know how many off hand).

> As I read this rule, it tells me that my amateur station (and it remains in the amateur service) is not prevented by other rules (such as limits on frequency or power) for radio communications under specific circumstances it mentions.

I interpret the above rule in a different manner.

I believe that this and other amateur radio rules and regulations must be interpreted in the *context* of their application to the amateur radio service. As I see it, the above section relaxes the rules pertaining to amateur radio operation in the event of an emergency, but *only* as they apply to operation within frequencies allocated to the amateur radio service. As an example, in the event of an emergency a novice or technician class licensee could operate using amateur radio frequencies and/or employing power and emission modes which they are not normally entitled to operate.

Therefore, the above referenced rule is not carte blanche permission for an amateur radio operator (in the event of an emergency) to operate a radio station on *any* frequency from DC to light in any manner they so choose. Since the above referenced rule is contained *within* the sections pertaining to amateur radio operation, it could only pertain to those frequencies allocated to amateur radio operation.

In support of my interpretation, consider some wording contained within 47 USC 301 (which relates to general provisions for FCC license requirements): "... no such license shall be construed to create any right, beyond the terms, conditions and periods of the license." Part of what this means is that a license for one service cannot create any rights for operation in *another* service.

I have seen the results of judicial review of other kinds of rules and regulations, and I would bet money that judicial review of the above exemption contained in the amateur radio service rules and regulations would result in a decision on the order of: "Mere possession of a valid amateur radio license, even in the event of an emergency, does not convey a special class or privilege apart from that of other persons not so licensed, as to permit the unlicensed operation in any *other* regulated portion of the radio spectrum."

I realize that there are readers of this newsgroup who will rather vehemently disagree with what I have just stated, but *think* about this question for a moment before replying: Do you really believe it is the *intent* of the FCC that the holder of a novice class amateur radio license be granted some magic privilege to use any part of the radio spectrum they so desire in the event of an "emergency"? If so, where would one draw the line? How about using say, 121.5 or 243.0 MHz to report a traffic accident? That'll get some attention quick-like! If we are to take the "literal" interpretation of the alleged exemption, such frequency usage would be acceptable!

It is my belief that should an amateur radio operator actually utilize a public safety radio service channel without specific prior authorization to report an "emergency", there would be no choice but to make some *considerable* effort to prosecute such amateur radio operator. To fail to make such a prosecution would set a precedent that would no doubt be *very* disturbing to public safety authorities.

Since you asked, Yes I do and for the price it's a real steal!

It's called MacSat and it's a steal for $10. I've compared the output with the stuff churned out by the mainframe at work and the accuracy is excellent. It allows direct input of NASA 2 CARD ELSETS (found in this same news group) or the painfully slow manual AMSAT format. I have used it with a 512KE, a Plus, a Mac SE and a Mac ll. I haven't heard from thompany in a while (4 months) but I believe it's still in business. The address is listed below.

B E K Delevopment

1732 74th Circle NE
St Petersburg, FL 33702

I used MacSat 1.1.3 on all machines and MacSat2 1.1.3 on the Mac ll.
Give me a shout if there are amy more questions.

I have used my non-type-accepted ham radio to call a fire dispatcher directly on two occasions that I can remember; once to call in a car vs. bicycle accident with injury, and once to cancel 7 engines that were racing to a wildland fire that had been extinguished. In both cases I was unable to access the local autopatch machine on 2 meters.

I strongly believe tha Part 97.403 fully supports these calls, and I would certainly do it again.

Note that I am VERY familiar with the radio protocol in use on the fire channel (as a legitimate user), and that most of the people on the "other end" know who I am. I have also checked my radio to be within commercial specs for frequency tolerance, off-channel signals, etc., so that I am not causing havoc to other users. I have never followed up a call with reports to the agency and to the FCC, but that wouldn't be a bad idea in the future.

Please be REEAL careful if making a direct call: you can cause more harm than good if you interfere with some other emergency. Remember that almost ALL traffic on these channels is emergency priority. Also take steps to ensure you don't mistakenly key up on a PSA channel thinking it is your favorite repeater... I store fire channels in my radio with the transmit frequency offset to an unused ham channel-- I figure I will need to transmit so infrequently that I can turn off the offset if the need arises. This also deters malicious use by somebody steals my radio (provided I don't wring their little necks first...)

-mike

CEO summary:
There seems to be some confusion as to the frequencies that LO-JACK operates on. Here in Mass., the transmissions are on 173.075 and sound a lot like packet. All the cruisers set up for LO-JACK tracking have a pattern of four 18" or so whips on the roof and a doppler DF setup inside. The beaconing car's ID code also shows up on a 6 (or so) character alphanumeric display. There have been a few news video clips of the system in action showing the cruiser display. I myself have also wondered how you locate a LO-JACK car inside an

aluminum trailer truck, and why car thieves don't carry scanners
tuned to 173.075???

hi out there,

recently someone asked for games implemented on packet radio. sri, i lost the
originator's email address.
dd4os, boris, has written something for the dec rainbow as a game server a few
years ago. maybe it works on ms-dos in general. i cannot really remember,
what the game was like, it was something like a lunar landing simulation.
due to our links here in germany it was incredibly slow when used via
digipeaters, but it worked well on point-to-point links.

if you like to contact him: boris is working at the ai-labs of the university
of hamburg, frg.
his email address is pasternak@informatik.uni-hamburg.dbp.de

if you cannot get through, send mail to me, i will forward it to him.

good luck,   bernd

97.205 Repeater station.
...
(e) Ancillary functions of a repeater that are available to users on the input channel are not considered remotely controlled functions of station. Limiting the use of the repeater to only certain stations is permissible.
...

However, non-repeater autopatches are very different. There are TWO stations involved. The base/remote station operates under remote control but is otherwise and ORDINARY station and can operate on any frequency, and in any mode, that the control operator and the station licensee is authorized for. The station of the USER is the auxiliary station. It has to be operating as an auxiliary station in order to remotely control a station. FCC rules require auxiliary stations to operate on 220.5 MHz and up, except on 431-433 MHz and 435-438 MHz. So the INPUT to an autopatch must be on those frequencies only. The OUTPUT can be anywhere else that is legal.

Note that if the OUTPUT is on 29.6 MHz, a Technician cannot be the control operator. A Novice cannot operate an auxiliary station at all, so therefore cannot use the autopatch unless someone else is acting as control operator.

Simplex autopatches on 2 meters are therefore not legal as described here because the auxiliary station would be on 2 meters and that is illegal, or the autopatch would be operating under control of a non-auxiliary station, and that is illegal, or there is not control operator, and that is illegal. This does NOT affect autopatches as part of a repeater because the control of the autopatch is under control of the repeater, and the connection of that control is wireline (usually). If it were not wireline, then the control link would have to be auxiliary.

A full duplex crossband autopatch can have its OUTPUT on 2 meters, but NOT its input. With so many dual band 2m/70cm radios around, such an autopatch with an OUTPUT on 2m and an INPUT on 70cm (except 431-433 and 435-438) would be the way to go. Putting the input on 222.1-223.91 MHz might temp Novices to use it, and that would be illegal.

Auxiliary stations must be under control of a control operator at a control point. But they may be under remote control via another auxiliary station to achieve this control. Eventually there is a live control operator.

An auxiliary station may be automatically controlled only when it is part of a system that includes a repeater station also being automatically control. (97.201(d))

As long as you can hear the 147.225 machine when it goes on the air, you could add a CTCSS tone to the TRANSMITTER on 147.225 and when you are using one of the newer HT's that has tone squelch, you can squelch out the intermod.

There are type-accepted portables available, and even Icom sells them.
Some are actually very cheap, too, so the cost is not the issue. I don't
know why one of these people would want a ham rig just to get a cheap
radio on their public service band. There are cheaper radios advertsied
in "Mobile Radio Technology" magazine.

>   Now we have the folks in this echo claiming that hams should be

I am not claiming that hams SHOULD be able to transmit on police channels,
but I am claiming that hams ARE able to transmit on police channels. I am
also claiming that certain FCC rules allow this transmission under certain
circumstances (like a real emergency).

Which would be cheaper? Getting a portable cellular phone with service,
or adding an autopatch to the local repeater with a phone line. DON'T
ANSWER ON THE NEWSGROUP HERE, just send me your check that covers the
cost for one year of whichever one you think I should have instead of
my current IC-32AT with out of band mods in place.

The price curve starts rising real fast at the higher capacity cells.
I have found the "knee" to be at about the 600 mah size. It might be
moving up to 700 mah size soon.

The rules in part 97 are there to limit the number CONSTRUCTED by hams so
that there is no loophole to the REAL restrictions on linear amplifiers
elsewhere in the FCC rules which prohibit manufacture, importation, sale,
etc. of such equipment.

Yes, Michele did see "ear" in 97.503, which shaved a few seconds off me
looking for it. But I will copy it here:

] 97.503 Element standards.
]
] (a) A telegraphy examination must be sufficient to prove that the
] examinee has the ability to send correctly by hand and to receive
] correctly by ear, texts in the international Morse code at not less
] than the prescribed speed, using all the letters of the alphabet,
] numerals 0-9, period, comma, question mark, slant mark, and pro
] signs ar, bt and sk.

So, how many would go along with petitioning the FCC to change just the
above paragraph to: [new text in all caps]

```
+ 97.503 Element standards.
+
+ (a) A telegraphy examination must be sufficient to prove that the
+ examinee has the ability to send correctly by MANUAL MEANS and to
+ receive correctly WITHOUT THE BENEFIT OF DECODING DEVICES, texts
+ in the international Morse code at not less than the prescribed
+ speed, using all the letters of the alphabet, numerals 0-9, period,
+ comma, question mark, slant mark, and pro signs ar, bt and sk.
```

This would ALLOW a device that turns on a light when it hears a sound
because such a device would not be decoding the Morse code.

I have read in some law books that many states of laws that allow a restrictive covenant to be removed if you act in such a way that violates that covenant and no one complains. I have read that an example timeframe is about a year. See your lawyer BEFORE you do this. I posted this just to let you know that in some case there can be hope, and that you should see your lawyer to find out about it.

You are choosing to interpret 97.403 as waiving some rules but not others.
Tell me how you come to believe that one rule is covered by 97.403 and not
some others. How do you decide WHICH rules are to be waived?

>   Therefore, the above referenced rule is not carte blanche permission
> for an amateur radio operator (in the event of an emergency) to operate a
> radio station on *any* frequency from DC to light in any manner they so
> choose. Since the above referenced rule is contained *within* the sections
> pertaining to amateur radio operation, it could only pertain to those
> frequencies allocated to amateur radio operation.

Sure, it is contained WITHIN amateur rules. The rules limiting the power
and the rules limiting the frequency are BOTH present in part 97. How
do you decide WHICH rules can be waived and which ones cannot?

>   In support of my interpretation, consider some wording contained
> within 47 USC 301 (which relates to general provisions for FCC license
> requirements): "... no such license shall be construed to create any
> right, beyond the terms, conditions and periods of the license." Part
> of what this means is that a license for one service cannot create any
> rights for operation in *another* service.

Reread my original posting:
As I read this rule, it tells me that my amateur station (and it remains
                                                          ^^^^^^^^^^^^^^
in the amateur service) is not prevented by other rules (such as limits
^^^^^^^^^^^^^^^^^^^^^^
on frequency or power) for radio communications under specific circumstances
it mentions.

So as I am interpreting it, if I were to operate this way, I would still be
operating AS AN AMATEUR and as part of the AMATEUR SERVICE, in communication
with a station in the LAND MOBILE PUBLIC SERVICE. I would be using 97.403 to
waive 97.301. You mention the possibility of waiving only parts of 97.301,

and all of 97.313 and 97.305 through 97.311.

I have seen the results of judicial review of other kinds of rules
> and regulations, and I would bet money that judicial review of the above
> exemption contained in the amateur radio service rules and regulations
> would result in a decision on the order of: "Mere possession of a valid
> amateur radio license, even in the event of an emergency, does not
> convey a special class or privilege apart from that of other persons not
> so licensed, as to permit the unlicensed operation in any *other* regulated
> portion of the radio spectrum."

Were these judicial reviews all dealing with the case of an actual
emergency? If not, then I believe they won't apply.

By the way, there is no indication that 97.403 cannot also waive rules
97.5 and 97.7.

>   I realize that there are readers of this newsgroup who will rather

> traffic accident? That'll get some attention quick-like! If we are to
> take the "literal" interpretation of the alleged exemption, such frequency
> usage would be acceptable!

First of all, I am not talking about an "emergency", I am talking about
and **EMERGENCY**!!!

You draw the line on common sense and what is actually necessary.
You cannot use the rule to transmit with 10,000 watts of power when
100 watts was clearly going to get the emergency communications through.

>   It is my belief that should an amateur radio operator actually
> utilize a public safety radio service channel without specific prior
> authorization to report an "emergency", there would be no choice but to
> make some *considerable* effort to prosecute such amateur radio operator.
> To fail to make such a prosecution would set a precedent that would no
> doubt be *very* disturbing to public safety authorities.

By all means an investigation would be called for. But I do believe that
if the correct actions were taken at the time of the **EMERGENCY**!! then
cool and sane heads will prevail and no formal charges of rule violations
would be applied. But it better be a real **EMERGENCY**!! and it better
be the case that the particular rule "waivers" you took via 97.403 were
actually necessary to conduct the communications within the time period
necessary.

Larry, since you are so adamant about this, then I might suggest you
petition the FCC to reword (or even to delete) 97.403 so it does not
cover so many possibilities, so vaguely.

I believe they made it vague for a reason, and that being to not set in
stone any particular "waivers" and to give the prosecuters and the judges
some leeway in deciding cases.

The precedent I am afraid of is one where people WON'T use an available
radio when it is absolutely necessary.

In response to buzz here are my findings regarding the 590T

>I just picked up a brand new Alinco DR-590T and have had some problems that
>I would like to share with you all out there in ham-net land. Maybe someone
>out there can help me with a couple of these problems.

I guess not too many people have these rigs yet otherwise I would not have
to respond to your request. I hope there are others besides yourself that
are interested in this information. In any event this is what worked for
me (sans jinglish). I am not however responsible for what you do to your
rig . . . etc.

>1, I got this unit because of all the cool features it is supposed to have,
>including cross-band repeat. The instruction manual does not even mention
>this feature. After calling Alinco I found that this was a feature functions
>only after modification. They said (more than a week and a half ago) that they
>would send me the modification instructions. I haven't heard anything from
>them.

If you ask them (nicely) there are (a few) dudes at Alinco that are willing
to help and are smart enought to be helpfull (there is a differance ;-}).
They can fax you the information or even send it to you next day air at no
charge if you ask politely or are VERY persistant (as in my case).

Now the big news . . . to modify the rig to xmit out of band (to call the cops etc ;-}), to operate as a cross band remote, etc. follow these easy steps.
1) remove the control head from the unit (2 screws on each side of the forward part of the rig, near the control head).

2) hold the control head in your hand face down and remove the two screws you see on the back of the control head.

3) remove the cover from the back of the control head (it snaps off)

4) locate a blue loop of wire. There is only one blue loop of wire.

5) cut, unsolder, remove, destroy, nuke, the blue wire (your choice) [I neither advocate nor encourage the indiscriminate use of nukes]

6) undo step 3

7) undo step 2

8) undo step 1

9) connect the rig to antennas, power etc as outlined in the manual.

10) hold down the function key and turn on the power

This is what you will find . . .
The rig now transmits everywhere.
it now will display (not receive) 800Mhz band and 300Mhz band on the 440 side of the display in rotation (press the uhf switch to switch from band to band)
It will now display (not recieve) the aircraft band (yes it does indicate AM) on the 2 meter side of the rig. There is no AM detector presently but I am working on it.

Cross band operation:
To enable cross band remote press (and hold) the funciton key and then (while still holding the function key) press the vhf switch. Cross band operation is now enabled using the displayed TX and RX frequencies. Splits still funciton in cross band operation so don't link 2 repeters together! Frequency selection for each band can be from the vfo, memory, or ARM (a cool Alinco function).
To disable cross band operation simply press (and hold as before) the funciton key and press the uhf switch. Note: failing to hold the f-key down and then pressing uhf or vhf enables a strange function that I have yet to figure out.

>2, The Autodialer (an option for the 590E according to page 13 of the manual)
>did not work as in the insturctions. Another call to Alinco and I found
>that it is also an option in the 590T. On page 19 it was pointed out to
>me is a note to this effect. These instructions are also unclear. Anyway
>I went out and purchased the required DTMF unit and installed it. Now I
>can store the numbers in the autodialer's memories, however I cannot get

>the rig to autodial any number except the number stored in memory #1. I
>have tried every possible interpretation of the directions on page 13 of
>the manual and had no success. Another call to Alinco . . . they told me
>that they knew that the manual was written in jinglish (japanese/english)
>and was hard to understand. They said that they would send me a complete
>manual written by someone who spoke english as their primary language. I
>asked them why this manual was not provided with the rig and they said that
>it was free to anyone who asked for it ?!?!

Simple problem . . . a typeing error (translation error?).
Turn to page 13 of the instructions
find "Transmitting the Stored Autodialer Number:(DR-590E: Option)

Step 2 should read:
Enter DTMF pad code c14 and select the desired autodialer channel.

>3, This rig is supposedly able to receive DTMF codes from another transmitter
>What will allow remote control of the rig (useful as a very flexible cross
>band repeater). I have not been able to get this to function on my rig at
>all. I can only hope that possibly the modification they promised to send
>me will enable this function or that the new english directions will beable
>to explain how to make this happen.

Even the grand Alinco wizzard has not figured this out. He said that he
was working on better directions and that as soon as he had them he would
send them to me.

>4, The remote page/DTMF squelch function are completely cryptic I hope they
>are also explained in the english directions.

Same deal as above. However if you sat around with a friend who also had
a similarly equipped rig you could probabily figure it out.

>Anyone with any mods or operation instructions for this rig please let me
>know. Am I the only one with these problems? Does anyone have any solutions?
>Is Alinco always this slow? etc.?

Here are your mods/instructions. Yes I believe you are. I found the solutions.
In my experience Alinco has always operated in this manner.

>I will post a summary when a solution is found
>so send responses to me at my address:szarekw@lonex.radc.af.mil

Here is the summary. In case you haven't figgured it out by now I am answering
my own query. I just figgured someone might want the info.

Considering the current downswing in real estate sales, we might be able
to gain a very slight bargaining position.

I know for instance that when I am ready to buy a house, the terms of by
offer will specifically spell out a number of restrictions that cannot be
in the contract or referred to in the contract of sale (so I can get by
offer money back if it turns out to be the case). For instance I want no
restrictions on things like:
1. Outdoor antennas.
2. Radio transmitters of any kind. [you better watch that one]
3. Swimming pools.
4. Gardens of any size on non-frontage.
5. Color of exterior paint.

> priority. Also take steps to ensure you don't mistakenly key up on a
> PSA channel thinking it is your favorite repeater... I store fire
> channels in my radio with the transmit frequency offset to an unused
> ham channel-- I figure I will need to transmit so infrequently that I
> can turn off the offset if the need arises. This also deters
> malicious use by somebody steals my radio (provided I don't wring
> their little necks first...)

Because the offsets on VHF frequencies are so odd and different, I am
afraid I might not remember them in the real emergency. I can remember
them at this moment:
        154.070 +1.945
        155.040 +3.885
but I might not when trying to overcome panic. So I have programmed
them in, except that I programmed them in the reverse direction.
All that I need to do is press the DUP key a couple times and I have
it set to go. The PL tones are programmed as well (though maybe I
should program them as OFF, but just program the frequency).

Thus my radio is less secure than yours in terms of malicious use by
someone who might steal it. But someone who just does not know these
things is not likely to get the DUP set correctly and then NOT be
tempted to spin the dial on top, which would wipe the settings with
the memorized values in the next channel. They'd have to be smart
enough to program the thing, and they'd be able to program whatever
they wanted then anyway. Of course there is the issue of having such
a fully programmable radio, but I believe that is a distinct issue.

The information concerning special permits for foreign operators

was obtained from the London, Ontario regional office.

I have checked with the CRRL and they feel that the existing
recipricol agreement specifically between US and Canada has
not changed.

They also confirmed that the DOC is moving away from having
special permits so any requirement for US amateurs seems
almost impossible.

Since the RIC has not even been printed yet, it may be some
time before an actual policy statement can be viewed for
interpretation.

Unless officially announced in the meantime, I would say that
US amateurs shouldn't worrry too much about operating in
Canada.

By the way Lyndon, if you can get any more of those $5 UHF
radios, I'd be interested in about four (HI). We sure don't

get deals like that around here...

73s for now.

>What makes you think your receiver's problem is caused by transmitted "crap"?

Well, perhaps my logic is imperfect here: I hear it on other receivers
than my TH215, including an IC-255 and a VHF scanner (yes, I know how
bad these receivers are :-))

>Intermod in your receiver is not caused by spurious emissions. And if you
>have your TH215 hooked to any antenna other than the little rubber one that
>came with it, the problem will be worse.

I don't understand ... why? Just because the outside antenna can "hear"
better?

I have been asked for help in contacting a Peace Corp volunteer
in Uganda via Amateur Radio.  A friend is fearful of his safety.
Is there any one here who knows of an amateur in or near there?

I would prefer a packet station, but an HF voice station would be
fine.

If you know of a packet station in that area, please send me his
address and call.

If you know of an HF voice station, a sched. and freq. would be helpful.

Heres a chance to cut through the flames and see the light.
Thanks

Apparently my opinion was misunderstood by others, including Patrick.
What I was trying to say is that all aspects of ham radio are well and
good, but let's not forget what the hobby/service is all about. Just
for the record, I, too, chase DX, work contests, etc. I'm in no way,
shape or form trying to say that any of these things is detrimental to
the hobby, but rather that there are some fundamentals deeply rooted in
the hobby that shouldn't be forgotten by those of us that do participate
in radio sports.

I am trying to find the latest (since the change late last year) Novice question pool somewhere that can be downloaded.

ARRL only sells a $18 diskette and Rich Bono's AUTOEXAM (excellent program) has only the old version of the questions. Tried a couple of ham BBS' (N8EMR, et al.), but the old questions were there as well.

Anyone know of a source?

Regards,
Greg Bassett - KJ6EP

With the assistance of devon@cs.buffalo.edu, a mailing list has been setup for amateur radio astronomy enthusiasts. The main purpose of the list is to exchange information and ideas relevant to the persuit of amateur radio astronomy. Topics include (but are not restricted to) system design ideas, where to get equipment, available literature, what to look for once you're up and running, etc, etc.

Send your subscription requests to radio-astro-request@cs.buffalo.edu
Messages may be sent to radio-astro@cs.buffalo.edu

It continues to amaze me how the makers of HT's fail to provide them with adequate front-end selectivity; i was recently looking to buy a simple (Cheap!) 2-meter HT, and *NONE* of the various ones i trialled in the dealers seemed immune to 'squawks'. It generally seemed that 'the more features, the worse the RF performance'. One, which shall remain nameless, suffered terminal intermodulation on a 1/4 wave whip.....

What *is* the point on providing sub-microvolt sensitivity if the thing dies laughing at anything over a millivolt? Maybe if the designers of these radios were forced to use them in a real environment (one with more than one transmitter!) they would change their mind.
Get the designers out of their shielded RF test-environments and into a big city full of nasty, intrusive RF.
Why install scanning etc. on a radio when the squelch is kept open *ALL THE TIME* by garbage from the local paging TX?

p.s. in the end i bought an ex-commercial HT; it suffers no ill effects on receive, even when i am transmitting on the same band...

Eat your hearts out Yaesu, Kenwood, Icom, I am sticking with Motorola from now on.

p.p.s. a HT220 can be used to club muggers, AND it will still work as a radio afterwards...

I do not like the idea of ham radio becoming an 'Olympic sport'; what
would be the criteria for receiving the Gold medal? Rudest contest
operating procedure? Widest splatter? Worst audio quality?
Presumably you would test for use of illegal amplifiers in the same way
as competitors are tested for performance-enhancing drugs....
If it does have to come, then i would suggest that the regulation should
reward cunning, ingenuity and skill rather than brute-force. An
electronic equivalent of orienteering is what i would like to see. Any
such competition must, at all costs, avoid the situation that prevails in
Formula 1 motor-sport, where anyone who comes out with an innovative
technique (active suspension, ground-effect) everyone else appeals
against it and it gets outlawed. This is a farce!
Maybe a ban on using commercially-built radios; what about a competition
based on 'Heres a dead TV set; who can convert it to a transmitter and
transmit 1000 words error-free in the shortest time....)
Oooer, i have just realised.... the result would probably be a **CW**
transmitter!!!!; no good as a spectator sport, the masses would not
understand..... no use for the advertising concessions!!!!

Sorry to post this to the net, but once again, I can't seem to get there from here.

This is in response to a request I had some time back for information regarding a FEMA grant our county got to purchase packet radio equipment. We received a matching grant for a $6K package to buy two systems consisting of a laptop PC, two meter radio, TNC, ruggedized carrying case for it all, and associated parts and pieces.

Carl,
I only have sketchy information at this time. You would be best to write to our Emergency Services Director for the information on what he submitted.
Write to:

Marquette County Sheriff Dept
W. Baraga St
Marquette, MI 49855

ATTN: Lt Mike Zorza, Emergency Services

Phone: (906) 228-6980

Mike is a pretty good guy and has spent many years in the Emergency Services business and is also very good at getting grants. I'm sure if you write or call him, he can fill you in on the details.

Hope this helps.

Good luck in getting your ham ticket.

73,
Michael

Are you asked personally when your home state seeks to raise its income tax from 5% to 5.75%? Of course not! You have elected representatives in the state legislature to do that for you. The same goes for the ARRL. They have division directors and section managers. If you don't approve of something they're doing, contact your local representative.

CB handles are probably not a good idea, but it's better than making the
dispatcher say "will the person at the accident scene please come back on
the radio, we have another question".

Isn't it about time to reduce the net bandwidth taken by this subject. The
FCC has closed its comment periods, so now let's drop the subject for a while.
I can't see how continued bickering here about the cw requirement
serves either camp on the issue.
At least until the FCC comes out with the "wrong" decision (whichever side
you're on).

Regards, W3OTC

This is a different situation indeed. Speaking as an experienced police dispatcher, I would say that the department would wonder why the ham insisted on using his/her own radio for something that urgent. Calling for an "officer down" or "officer in trouble" is probably the most urgent call you could make to a police department (by their standards). Certainly it would justify ANYONE'S use of the patrol car radio.

On the other hand, it is quite silly (yes, I've heard it done) to autopatch an accident report with emergency units already at the scene.

A few years ago, when the T-birds were at Moffet (1988?) the "boss" was repeated on 123.40, the "common airshow frequency" mentioned in an earlier posting.

The response I received from the previous Solar Terrestrial Forecast and Review posting was large enough that I have decided to make the reports a regular weekly feature. In addition to the weekly reports, I will post special flare reports for all major flare occurrences as well as special geomagnetic storm alerts and descriptions/forecasts of these events. However, these special reports will only follow major noteworthy events and will not be a regular part of the Solar Terrestrial Forecast and Review.

Comments and/or suggestions are welcome.

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---
October 06 to October 16, 1990

Report Based In-Part from Data Obtained from the
Space Environment Services Center
Boulder Colorado

BRIEF SOLAR TERRESTRIAL REVIEW AND SHORT-TERM FORECAST

Solar activity between 29 September and 06 October was Low. No major active centers were visible on the solar surface this week, although several moderately large spot groups did traverse the disk. In particular, Region 6294 (located at S05W57 on 05 October) is the largest visible spot group on the disk, covering an area of 1,440 million square kilometers (900 million square miles) encompassing a total of 26 sunspots. Although this spot group is moderate in size (class DKO system), it is a relatively simple and non-threatening bipolar group. Region 6294 is the next biggest active region (located at S16E48 on 05 October). This region covers an area of 1,290 million square kilometers (806 million square miles) but only encompasses a total of 7 individual sunspots. The largest spot is, however, a visibly large k-type sunspot. Region 6294 is a relatively simple bipolar group. Region 6297 (located at N20E09 on 05 October) is a relatively compact bipolar system consisting of 24 small spots (largest spot a type a-spot) within a region boundary of 330 million square kilometers (206 million square miles).

Flare output this week was low. The largest flares were C-class x-ray events and subflares. Several bright surges occurred this week, two of which occurred on 05 October. The first bright surge occurred near N25W90 at 06:07 UT and was attributed to Region 6303 which has now crossed the western limb. Region 6283 also produced a bright surge near S10W90 at 12:37 UT while crossing the western limb.

Solar activity is expected to remain low until at least 10 October when a few moderately active regions are due to return. Predicted 10.7 cm solar flux values for 07 to 08 October are 170 and 175 respectively. There is only a 20% chance of an isolated M-class flare throughout the next three days. There is no chance of an X-class or a Proton flare from any of the simple active regions currently on the solar disk.

The most recent sunspot number (for 05 October) was 181 accompanied with a 10.7 cm solar flux of 169. The solar x-ray background intensity on 05 October was at a class B8.6 level. A brief radio burst of 245 s.f.u. occurred between 01:41 and 01:42 UT on 05 October at a frequency of 245 MHz.

Coronal hole effects are believed responsible for the recent increase in geomagnetic and auroral activity. Periods of Active to Minor Storm levels have been observed at high latitudes accompanied with visual auroral activity. The increased geomagnetic activity is expected to remain at mostly Unsettled levels for the next several days. Activity is expected to increase to mostly Unsettled to Active levels between 08 October and 13 October due to coronal effects afterwhich it should again subside to Unsettled levels. No geomagnetic storms are currently anticipated from this activity, although localized minor storming may be possible at high latitude and nothern middle latitude locations. Global geomagnetic activity is expected to keep the planetary magnetic A-index at or near 15 for the next two days (ending 08 October).

Radio propagation over middle and high latitude paths has been disrupted due to auroral activity. Moderate rapid fading in middle to high latitude path signals is anticipated for the next several days until geomagnetic and auroral activity subsides. Geomagnetic and auroral-based signal aberrations will be worst between approximately 10 pm and 5 am local time for middle and high latitude paths. Low latitude and southerly middle latitude paths should escape many of these effects, retaining mostly good to very good propagation throughout the period.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 06 OCTOBER

Region #	Location	LO	Area	Class	LL	Spots	Magnetic Type
6292	S16W27	286	0030	AXX	02	003	SINGLE POLARITY
6294	S05W57	316	1440	DKO	10	026	BIPOLAR
6296	N33E04	255	0030	BXO	03	002	BIPOLAR
6297	N20E09	250	0330	DAO	10	024	BIPOLAR
6300	N12E32	227	0420	DAO	09	016	BIPOLAR
6302	S16E48	211	1290	DKO	07	007	BIPOLAR
6304	S15E06	253	0180	DAO	04	007	BIPOLAR
6305	N17E27	232	0060	BXO	02	005	BIPOLAR
6306	S23E65	194	0000	AXX	00	001	SINGLE POLARITY

NOTES:

"Location" is the location of the center of the active region as measured from the central meridian of the solar disk. "LO" represents the actual heliographic longitude of the active region. "Area" is the area of the active region given in million square kilometers. "Class" represents the Modified Zurich (McIntosh) Sunspot Group classification (consult a good text on sunspots for a description of these classes). "LL" represents the angular extent of the active region (in heliographic degree's). "Spots" gives the number of sunspots which were visible within the active region at the time of observation (this value is dependent upon the location of the active region on the solar disk). "Magnetic Type" specifies the type or class of magnetic behavior within the active region. Potentially potent active regions almost always have complex magnetic field configurations. Therefore, the potency of a specific active region can usually be estimated by observing the magnetic type of the active region. Single and bipolar regions are usually too simple to produce significant solar activity.

ACTIVE REGIONS DUE TO RETURN BETWEEN 06 OCTOBER AND 08 OCTOBER

Region	Latitude	Longitude (Helio.)
6263	N10	152
6266	S27	145
6267	S12	145

    | Geomagnetic Field |  Wed.  |  Thu.  |  Fri.  | Sat.|  Anomaly   |
    |    Conditions     |    Given in 3-hour intervals   | Intensity  |
    |_________________________________________________________________|
```

NOTES:
       This graph ONLY depicts geomagnetic conditions observed at Boulder, Colorado for the past 87 hours. Conditions to the north of Boulder will generally have slightly higher activity than Boulder, while conditions to the south of Boulder will likely have lower activity than those depicted here. However, the plots should present a good approximate average of planetary geomagnetic conditions.

       "Anomaly Intensity" is meant to represent nothing more than a very rough guide to the --potential-- interaction geomagnetic fluctuations --might-- have on earth-based systems sensitive to magnetic fluctuations (ie. electrical power distribution networks, telecommunications networks, etc.).

       For radio signal propagation purposes, plot lines are approximately proportional to propagation quality when plot lines are below Minor Storm conditions. Propagation quality may deteriorate rapidly (ie. non-proportionally) when plot lines reach or exceed Minor Storm levels. Complete radio blackout conditions on all short-wave frequencies may occur if plot lines reach or exceed Severe Storm levels.

PLANETARY 10-DAY GEOMAGNETIC ACTIVITY OUTLOOK (07 OCTOBER - 16 OCTOBER)

NOTES:
       Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in

excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

NOTES:

Latitudinal boundaries are the same as those given above for radio propagation quality. Periods of high auroral activity may be suitable for auroral-propagation. Locally visible moderate auroral activity will almost always cause moderate to strong deterioration in HF signals, while locally visible high auroral activity will render most HF bands useless.

Auroral activity is defined as follows:

NOT VISIBLE:	Not visible
LOW:	Diffuse, inactive auroral activity visible very near the northern horizon for mid and low latitudes.
MODERATE:	Visibly active, but not exceptionally bright auroral activity most visible above the northern horizon for mid to high latitudes. This type of activity usually encompasses torch-like (or beam-like) aurorae mixed with low-intensity curtain aurorae.
HIGH:	Visibly very active, with periods of bright, pulsating curtain aurorae possibly mixed with moderate intensity zenith aurorae. Can occur to the north as well as stretching up near the zenith, particularly at middle latitudes. There may be some color fluctuations discernable.
VERY HIGH:	Very active, very bright and very colorful auroral activity possibly mixed with intense zenith and curtain aurorae. Visibly strong pulsations with

auroral boundaries to the zenith, stretching even partway to the southern hemisphere of the sky.

EXTREMELY HIGH: Rare, incredibly bright auroral activity with rapid color and brightness fluctuations mixed with very strong rapid auroral pulsations visible throughout the entire sky.

There are three plotted lines per day in the auroral activity prediction charts. Each of these three plotted lines represent three periods during the evening/morning when auroral activity can be seen. The first line represents the evening twilight period. The middle line represents the --local-- midnight sector, while the last line of each day represents the morning twilight period.

The auroral activity predictions charts are heavily based on recurrent phenomena and may not be accurate in the longer-term due to unforseen and unpredictable transient events (ie. such as solar flares).

The visibility of auroral activity depends on your location and the brightness of the sky (which is dependent upon both city lights and lunar phase). These charts do not account for these variations. The charts are based on dark-sky conditions (lunar phase excluded). Aurorae occur independent of sky brightness, so just because auroral activity may not be directly visible (due to lunar phase, for example) does not mean auroral activity isn't in progress.

I post the AMSAT news to rec.ham-radio weekly, but had never heard of
aus.radio.amsat. When I try to read aus.radio.amsat, ssc comes back
with "no such newsgroup."

Are you outraged at ME because demonstrating the use of hand signals is
still required on the drivers exam?  Are you outraged at ME if you go to
engineering school, and are required to take some liberal arts courses?

Fairly recently, I was in favor of some kind of Morse-free ham exam.  But
now I am not so sure.  I'm not so sure that the code test is too tough
anymore, and I wonder if we really need to eliminate the only demonstration
of operating skill on the exam.

I keep running into folks (in person, not on rec.ham-radio) who have some
kind of interest in ham radio, but say they can't learn the code.  After
further questioning, my suspicion is that they have never really spent
any time and effort on it.  There are a lot of folks who have a 2 minute
attention span.  I have a feeling that if we eliminate one part of the
exam, there will still be folks complaining about the other part.

The tests have slowly become easier and easier in the years since I
passed my Novice as a 12 year old in the mid-1960s.  I believe that
there will always be pressure to make the tests easier.  When do we
```

stop?

I believe that it was too bad when a new licensee wrote a nice simple posting on here saying that he had studied the code, passed the exam, and found the experience enjoyable, and then someone describes their TOTAL OUTRAGE, as if by passing the exam he was engaging in some kind of evil conspiracy to drag us back into the 1950s.

>   3) What is needed is a nationwide standard repeater code for accessing emergency services. Repeaters adhearing to this standard would be highlighted in the Repeater Directory. Any visitors to an area needing assistance would simply look up the nearest repeater with the standard code and call for help.

This is a shame. Most of the repeaters here in Atlanta use * up # down for the emergency patch and other proprietory codes for the general patch. One problem is that there are greater than 20 jurisdictions in our coverage area that use enchanced 911. You will, of course, be routed to the jurisdiction WHERE THE REPEATER is located not where you are. There are intertie methods used by the 911 operators, but this is causing more and more problems. Our club's two machines are unique in allowing OTHER three digit codes to access direct lines into the emergency centers of the other jurisdictions as well as 911 to Fulton County.

I am not a personal fan of autopatches in general and find that most of the emergency patches I monitor about traffic accidents result in a redundant report since a cell phone user has already reported the incident in a form the dispatcher is more familiar with handling. I do support the club patch, however, for those rare times when the emergency patch has been first to report an accident. I don't use the general patch for a several reasons. I find very few times when it is necessary to make a call that would be legal. I find that most non-hams have difficulty dealing with a half duplex call. And I prefer privacy for my personal calls.

We have several club members who use the patch very very frequently. Some of their calls seem of dubious legality and most seem very frivolous. Our club rules say that patches have priority so we have to patiently stand by and let the patchers play. More times than not the content of the patch is "Honey I just left the office". An office that I'm sure had plenty of telephones available. Phew! At least the pseudo business users are getting music on hold more and more lately. Even they realize they can't get away with listening to music on the amateur bands.

Sorry about drifting off the subject, but I just listened to three of these nimrods making dumb patches.

Howdy!
Saw the interest for University ARC's so I thought I put two or

three cents in. The Texas A&M ARC (W5AC) is another one of those
oldest clubs on campus. Actually we have been around since 1912.
We operate all HF bands, 6m, 2m 70cm and a few members even fool around
with 10.328 Ghz. We are also active on AO-13 and packet--I think we
have 4 nodes here at TAMU--you would have to check with our packetmaster
AA5AV. If you hear us on, give us a shout. Generally someone is operating
around lunchtime (12 - 1:45 CDT) on weekdays. Anyone wishing to sched
can give me a yell via network mail or on the air.

Incidently W5AC will be operating a special events station on November 29, 1990
CQ Bonfire will be active on all bands depending on the number of people
in the shack that can work the station during the day. This special events
station will be commemorating the 80th burning of the Texas A&M Aggie Bonfire
which is held each year before the game against Texas (t.u.). All stations
are invited to work W5AC. More details later.....

If I were a "pro" car thief, I would have a large, 18 wheel truck that
I could drive the car into after ripping it off.
This 18 wheeler would be heavily shielded. Sort of a large, mobile
Faraday cage :-).

I have just discovered a way to turn off the policeman in the 2sat that stops the transmitter from operating outside of 140-150 mc. The only limitation is now transmit VCO lock range, which, out of the box, is about 137 to 162 mc. I'm sure by tuning a slug one could raise or lower this coverage "window".

To do the mod, you'll need a soldering iron with a VERY fine tip, some fine solder, some small screwdrivers, a 1N914 diode (or other small silicon diode), some fine (wire wrap) wire, and (probably) a magnifying glass!

Follow the directions on page 34 of the instruction booklet to take the unit apart. This allows the front panel to be removed from the radio. No further disassembly is required, or recommended. Watch out for the little springy-dingy that locks the battery in place on the radio (the book so cautions).

Looking at the inside of the front panel, you should easily spot the CPU chip. (it is even shown as a square symbol in the picture on page 34.) Just to the right of the bottom right portion of the CPU is a teeny three legged device, exactly to the right of which are three solder terminals where another such device could fit. Here's some ascii art:

```
  ||||||||||||||||||||
 |--------------------|
=|                    |=    vacant diode chip pads
=|                    |=                    |
=|                    |=             |
=|     C P U          |=                    /
=|                    |=   ---XX---     XX
=|                    |=   |      |
=|                    |=   -XX--XX-   XX  XX  <=== point A
=|                    |=
 |--------------------|      /        ---XX---  <=== point K
  ||||||||||||||||||||      |         |      |
                   |         -XX--XX-
                   |
              diode chips-----/
```

The scaling is pretty bad, but it's pretty easy to find the three unused pads, then look left for one diode chip, then down and to the right for the other, as shown.

To implement the mod, it is necessary to install a diode of your own from point A (anode) to point K (cathode) in the diagram above. These points are EXTREMELY close together, and the board is delicate, so I recommend the following:

Take a 1N914 diode and cut the leads to 1/8 inch or less, then solder fine (26 ga. or thinner) wires of different colors to the leads, noting which is the cathode and which is the anode. Now put a piece of heat shrink or tape over the diode so that only the little wires escape. This assembly can now be safely soldered into the circuit, and the unit carefully reassembled.

Reset the CPU (inside font cover of manual) and you're on the air!

I was trying to use a (non-amateur) repeater which has an offset of 6.46 MHz, and I couldn't get the 2sat to do it. It seems that, regardless of the selected "tuning speed" (from the SET mode), when choosing the repeater offset, you can only dial it in 25 KHz increments. Thus, 6.45 is a possible offset, as is 6.475, but 6.46 defied my most desparate and undignified efforts!

What gives? Is this the first computerized, synthesized ICOM radio that is less flexible than its predecessors with respect to this feature? Of am I the first ICOM owner who both needed the feature and is too dense to figure it out?

>This is a real shame! I can understand if clubs want to keep their
>autopatches private, but there should be a known code for emergency
>access. Here in AZ, the Arizona Repeater Association has 3 open-to-all
>auto-patches.

There are some real practical problems with this in the large metro areas(I'm going to use San Jose as a reference cuz that's where I'm most familiar...) In this of area we have ~14 different local police agencies, about the same number of fire agencies, the California Dept of Forrestry, California Highway Patrol, etc. If you dial 911, it will reach the dispatch center for the city the phone number is located in. This is of no help if your in a different city (a real easy thing to be in the bay area at least...) and the 911 dispatchers aren't equipped to re-route the call.

What the main emergency-oriented machines locally have is a couple digit number for each of the respective agencies. You bring up the patch, then enter the appropriate code. I believe the code numbers on the two machines are identical(someone care to correct me on this...I'm thinking of ASH and ADZ) The fly in the ointment is that each of these machines keeps the phone patch numbers private...you've got to be a member to know the codes.

Is this a bad thing...depends on the implementation. In my area I've NEVER heard a station who didn't have the codes not get through IMMEDIATELY. The members of these repeaters fall all over each other racing to the keypad to bring up the autopatch. The club policy is that ANYONE can place a call....they'll do the dialing for you if necessary (i.e. when you aren't a member....) Now this system probably breaks down in the wee hours of the morning when no-one else is around, but when a club decides to offer these services it is there right to determine how they're used....

Summary is the system we have locally works pretty well for our area.

> called electing a board of directors to run the afairs of the league
> on your behalf. Seriously, should every single item that the BOD
> deals with be put up for a general election? Seems to me that

I don't call an election of officers carte blanche to spend dues money hiring new staff. Any item that the BOD decides that involves adding salaries or otherwise committing large sums of cash should indeed be proposed to the membership first.

This is especially galling when the League has to ask for special contributions to fund its preparations for WARC '92. I think such preparations are among the most valuable services the League can perform, but asking me for extra money in almost the same breath as telling me they've decided to hire 3 new people without consulting with me is a bit much.

I don't mean to be arrogant-sounding about this. The "me" or "I" in the above paragraph should be taken to mean "me, the average ARRL member."

> Please, if you have a suggestion on how to change this to a method that
> would be efficient let me know....I'm one of those elected officials.

Pleased to meet you. While I'm not in your section, I will answer your request because I think something should be done.

How about posting an article in QST whenever the League wants to hire new paid staff or make major purchases for HQ? A reasonable

```
comment (or voting) period should be allowed - say 4 to 6 months to
allow for the Postal "Service" to deliver the QSTs (I never get mine
before the second week of the cover date month) and get the replies
back.
      Replies or votes could be solicited at the members' expense (I
would spend 15 cents to send a postcard) to either HQ or, perhaps more
reasonably, to the SMs.

 > basis.  I'd be glad to tell them of your ideas.  For that matter

 > their phone numbers on pages 7/8 of QST.
 >
 > 73's de Steve KA6S
 >         SM, SCV Section

      I do appreciate your taking the time to respond and to pass back whatever
reply I would make.  And you're right, I should stay more in touch with my
local SM if I'm that concerned.  Lesson learned...

]it!  It is easy to find out the 911 emergency codes for almost every
```

]repeater in the state of Hawaii. If you don't know exactly what it is,
]everyone has nearly standardized on one of the following:
]911, *911, or *9.
]
]It wasn't anyone else's fault for not sitting around waiting for
]you to have an emergency... it was YOURS for not getting the information
]ahead of time. What do you use 2 meters for? Haven't you talked
]on any repeaters at all? Most clubs publish these codes in their
]newsletters. Are you in any clubs?
]

OK. Everyone who doesn't know how to access the autopatch on every repeater in the world turn your license back in to the FCC. It is our RESPONSIBILITY to have this information at our finger tips no matter wehre we happen to be driving.

What drivel.

Where were the control operators for all these repeaters?? FCC regs state that automatic operation requires a control operator. I couldn't find one on 14 machines.

As I said in the last message, the next time, I will just flag down someone with a celular phone and not even waste time with ham radio.

Having recently ordered a commercial band UHF radio (Icom IC-U16) for use in public safety (medical/sheriff rescue), I'm wondering what the FCC's latest is on the "Communicator" class license. I plugged through my Tune In the World book and think I can handle Novice and Tech theory/regs, but I'm enrolled in paramedic school right now, and don't want to spend the time dealing with morse code. I'm not looking for comments on whether or not YOU think a no-code license is a good idea, I'm looking for info regarding if this is going to happen or not, and if yes, when? I realize the FCC's proposal was for 220MHz and above, which is fine for now for me (the U16 will work in the 440MHz amateur bands).

What's the scoop?

-Kirk J. Smith, EMT-1A (EMT-P Intern)

]
]What *is* the point on providing sub-microvolt sensitivity if the thing
]dies laughing at anything over a millivolt? Maybe if the designers of these
]radios were forced to use them in a real environment (one with more than
]one transmitter!) they would change their mind.
]Get the designers out of their shielded RF test-environments and into a
]big city full of nasty, intrusive RF.

There are several things required for a good front end. The ones hard to get in a small, low power package are:
  (1) selectivity. Q takes space. Low Q parts require more of them, taking

space. For synthesized radios, which require a broad band front end, you need sharp skirts on a wide bandpass. That takes lots of poles/ zeroes, which takes parts, which takes space. Get the picture?

(2) linearity. Most front end problems are not caused by selectivity, they are caused by intermodulation or blocking (desense). Both of these are crucially affected by the amount of power consumed by the RF amplifier. You wan't low intermod, and little desense, you run a lot of power - like 100 mW to 1 Watt. This leads to lots of screams and hollering from hams who want low power drain receivers on their HT's, and don't realize that this leads to lousy front ends.

Of course, you could use a good balanced mixer, with no RF front end, but then you lose the sensitivity.

What WOULD be nice would be a receiver attenuator switch, which would toss in about 20dB in front of the receiver.

Don't be too hard on the designers of these radios. I doubt you could come close to the wonders that they create, given the constraints placed on their engineering.

I am trying to repair a vt100 that I got for the right price.
Upon inspection the monitor board had a blown(literally) electrolytic
capacitor(C439) and a toasted diode (CR408). I replaced the capacitor
but I am having difficulty Identifying the diode. The number on the
diode is RC2C-010GI (I think that is what it says, the G could be a
backward D but then the RC2C part would not be the right way.)
Does anyone know what this diode is and/or a replacement number for it.

Thanks
John

I have nothing to say about legality in this note; I am only
concerned with the effectiveness of 'calling the cops via radio'.

I have heard the public service radio traffic in SoCal courtesy
of a friend who moved there recently: they do seem to have
a much more common sense approach to communications than
us East Coasters do (I love it!--see Org: line).

Nevertheless, I doubt your transmissions would be taken seriously
by the dispatcher. If you appear to be in the same category as
someone who happened to pick up a stray police portable, they
would likely be more concerned with recovery of the radio
and finding out how you acquired it than much else, emergencies
possibly excepted. Convincing them of the genuine nature of
your call consumes time and reduces your effectiveness.
Net effect: no better off than calling on the phone.

Using the same language and procedure as the police do on the radio
would allow your message to blend in and be acted on as efficiently
as the rest of the traffic: I can personally vouch for that approach!

Yet, all these approches short-circuit the system. In the event
that there is a need for followup investigation of the incident,
there is no log tape of your call on the 911 phone system, so
if you get snafud along the way, you have little recourse.
Net effect: no better off than calling on the phone.

One local repeater has handled this problem very nicely. Here in the Chicago area, the authorities have set up a service where any cell-phone user can dial *999 and be connected to a central dispatcher who will determine where you are and contact the appropriate local jurisdiction depending on what needs to be done. The repeater trustees have configured the repeater so that the same *999 code will autopatch to the same dispatcher.

I haven't had a reason to use it yet, but it seems like a useful service, and something that other repeaters may want to emulate.

This is for Icom IC-R1 owners etc.....

I just received my R1 from my Japan mule. Boy is it small!
Anyway...the charger is for 100VAC. Since the power company
around here likes to sell more electricity (my line voltage
is 125VAC) has anyone had problems with using a 100VAC
charger on US mains? The thing gets kinda hot.

2nd question. Anybody got schematics for the little beastie?

What a cute little toy!

I would think that some RF monitoring could be of tremendous help to a thief trying to protect himself from LoJack. Since it isn't activated until after the car is stolen, a fleeing theif could find out the instant that the LoJack unit in the car was activated.

This would be a good time to ditch the car.

SB RTTYDX @ ALLBBS $RTDX0510
RTTY DX Notes 1of3 10/5/90

RTTY DX Notes for week ending 5th October 1990
BID: $RTDX0510
Part 1 of 3.

Who said the bands were dead? If you look at the reports, and there were over 300 stations reported this week, you will see that 21 and 28 MHz seem to have obtained the most attention from the people in the contest, while after the contest everyone migrated back to 14 MHz. Maybe we should look at the higher bands more often.

Our thanks this week go to I5FLN, JA1BLV, OD5NG, TG9VT, VE3XJ, VK2EG, W2JGR, W9CD and the Tri-State DX Packet Cluster Network. Thank you all for your assistance and abundance of information. Please keep it up.

RTTY DX Notes 3of3 10/5/90

RTTY DX Notes for week ending 5th October 1990
BID: $RTDX0710
Part 3 of 3.

QSL Information:

ZS9J is Leo Heinonen, 80 Sixth Street, Parrhorst, 2193 South Africa.

J39BS collects his cards via WB2LCH.

BY4AA says to QSL via DJ6BU.

4K0ADS is railway mobile and is travelling all over the country. QSL via RW3AH.

BZ4DAB, Tang, says to QSL to Box 085-205, Shanghai, China.

4U1ITU was operated by F6GMB, to whom the cards should be sent.
TG9VT says to QSL only via W3HNK.

Notes of Interest:

ZK3KY is now active from Niue Island and will be there for a month. She will operate around 0900Z on 21 and 14 MHz RTTY.

St. Pauls Island. FP5DX and VE1KM will operate from October 20 using the calls of CY9SPI and CY9DX and will operate RTTY. QSL via FP5DX.

Angola, D2. There is still much activity at official levels for the issuing of permits and licenses for an operation in this area. They are trying to get RTTY included in the permitted modes.

Malpelo Island operation is still on track for 2nd November.

South Sandwich and South Georgia are still scheduled for late
November/early December with the special calls of VP8SSI and VP8SGI
respectively.

GL DE DX1.

Written by VK2SG. Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA.

We won't know for sure until the FCC acts on the matter. "Stay tuned".

Some of use, on BOTH sides of the issue, believe it will happen. We just differ in the belief of WHY it will happen. In fact I have never heard anyone say they are confident it won't happen, but I have heard a few people say they are confident it will.

What particularly concerns me is HOW it will happen (if it does). I happen to believe that the FCC's proposal AS IS will severely damage ham radio, and of course the "no code" movement will get blamed. The ARRL proposal, which I feel does not do enough, is certainly far better than what the FCC proposed.

> This is a shame. Most of the repeaters here in Atlanta use * up # down for the emergency patch and other proprietory codes for the general patch. One problem is that there are greater than 20 jurisdictions in our coverage area that use enchanced 911. You will, of course, be routed to the jurisdiction WHERE THE REPEATER is located not where you are. There are intertie methods used by the 911 operators, but this is causing more and more problems. Our club's two machines are unique in allowing OTHER three digit codes to access direct lines into the emergency centers of the other jurisdictions as well as 911 to Fulton County.

Either the emergency system there is NOT properly setup, or else you have not arranged to have the repeater's phone line automatically route the call to a central dispatcher.

You should at least make sure that the dispatching computer knows the number of the repeater, and brings up instructions to the dispatcher for all calls coming on in that number to explain that it is coming in over a wide area, and that it is operating via radio. That avoids having to explain all this to the dispatching during the call.

> I am not a personal fan of autopatches in general and find that most of

> dealing with a half duplex call. And I prefer privacy for my personal
> calls.

This is one reason I am trying to find a way to put up (not as part of a repeater) a FULL DUPLEX patch. Among the difficulties in this:

1. Manufacturers of patch equipment don't know how to deal with full duplex very well. They think it cannot be handled by other than direct access to the discriminator of the receiver to detect the presence of carrier, even though a fast attack, long hang, VOX, on an ordinarily squelched radio will do the job with no modifications.
2. Full duplex requires split band operation, which not all hams yet are prepared to do, though many more are starting to get the equipment.

> We have several club members who use the patch very very frequently. Some
> of their calls seem of dubious legality and most seem very frivolous.
> Our club rules say that patches have priority so we have to patiently
> stand by and let the patchers play. More times than not the content of

> had plenty of telephones available. Phew! At least the pseudo business
> users are getting music on hold more and more lately. Even they realize
> they can't get away with listening to music on the amateur bands.

I might suggest bringing up a rules change, or finding a new club. The priorities should be based on WHAT the communications purpose is, not on what means were used to do it, as long as both equally require repeater access. Sure, communications that could be done simplex SHOULD be done simplex. Two stations running brick amps and yagis can talk simplex across even the largest towns unless they are quite hilly. There are many other situations simplex works fine. Always check the repeater INPUT frequency, and if you are receiving the other station, suggest a QSY to a simplex frequency (NOT 52.525, 146.52, 223.50, or 446.000)

> Sorry about drifting off the subject, but I just listened to three of
> these nimrods making dumb patches.

And these guys learned code?

Radio Shack sells a TDR to it's repair centers from National Parts for less
than $100. It's not a stand-alone, it's designed to plug into a scope, and
you can actually SEE impedance changes in the COAX and approximate where
the problems are.

If you don't want to buy one, KD5HM, Tom King, the designer, wrote it up
as a construction article for QST about a year ago. It's a far cry cheaper
than $1500!

On the Drake L-7, you simply remove a small screw on the bandswitch and remove the 10 meter reject filter on the input.

The theory, evidently, is that the typical CB'er won't have the technical savvy to figure this out, but the average ham will.

>dispatch. It is also a hazard during major incidents, when only a
>handful of people NEED to be on the air (Triage, Command, Operations,
>Staging, etc. - not EVERYBODY).

I'm sorry the personnel in your area are so poorly trained that they cannot be depended on not to get on the radio unless they really need to. The solution to that problem is training, not prohibition. People get into just as much trouble during major incidents, and need to get help NOW just as much, as in the average house fire. An emergency worker should ALWAYS be able to call for help. I suggest you post your opinions on FireNet (the FidoNet fire/EMS echomail conference) about why the average emergency worker doesn't need communications. Put your bunker gear on first.

>Even the ones who have positions reuiring the use of an individual radio
>have no business utilizing a non-type-accepted ham rig as that radio!

...except in an emergency. Repeat after me: THE RULES GO OUT THE WINDOW IN AN EMERGENCY. Keep repeating until you understand it.

>   He specifically stated that he was trying to use a non-amateur
>repeater. People who want CAP and MARS mods usually say so.

I hate to tell you this, David, but CAP and MARS repeaters aren't ham repeaters
either. Why don't you ask, and then THINK, before you flame? Or is that too
much to ask?

>> The original flame (from the same FidoNet newbie that I'm
>> responding to) was completely uncalled for.
>   I disagree strongly. And I don't think 2 years in FidoNet and 7

Not true about personal checks, unless they just changed their policy in the last month or two. I placed an order with them that I paid by personal check that recently, without problems. Money orders, of course, get processed faster, because they don't have to clear.

It sure was. I can think of several problems with the simplistic thinking above. First, not all areas of this country are blessed with 911 service yet. Second, as others have mentioned 911 if implemented would give you the dispatcher for the repeaters telephone exchange. Third, in our area we have a lid who likes to experiment with his touchtone pad. He never ids, rarely talks and never transmits long enough for us to DF him. If our patch were open, this jerk would be making funny phone calls to the county EOC. We have had to change all of our speed dial numbers from 3 to 4 digits since this *&@% figured out some of the 3 digit codes. Last, in my case I travel regulary from Harrisburg to Philadelphia and from Harrisburg to DC, there is no way I am going to remember all of the repeater access codes for these 2 hour trips.

If I can't raise anyone on 2 meters, I can always fall back on that <gasp> 27 MHZ CB set that I keep in the car for emergencies.

I've seen information that indicated that this was done for AM broadcast transmitters for filling in recetion areas. Is it possible to this for FM voice, like a repeater output, or even for FM broadcast for filling in areas?

Regarding the equipment upgrade at W1AW:

>Just out of curiosity, how old was the gear they replaced? Was it
>rendered unsuitable because of parts unavailability?

The old gear was old when I started to work at W1AW (1972). There was a master exciter that generated SSB, CW or RTTY signals at a fixed frequency (3 MHz). This signal was then heterodyned with a series of crystal-controlled frequency converters to the the required signals for 160/80/40/20/15/10/6 meters. (The 2 meter rig was a conventional multiplier scheme modulated directly on phone, and tone modulation on CW.) All this was tube-type gear "homebrewed" in the ARRL lab.

The kilowatt amplifiers were "homebrewed" by Bill Orr W6SAI and friends at the Eimac ham radio club. Each used a 3-1000Z final with either either a 4CX-250 (20/15/10M) or pair of 6550's (80/40) for a driver.

I imagine this stuff was getting pretty "long in the tooth" after 30 years or so of continuous use.

>and code practice purposes. It's also a fact that the bulletin and code

>practice transmissions are conducted by paid operators for whom the ARRL
>had to get a special dispensation from the FCC.

The story behind this is fascinating. W1AW had been using paid operators since 1936 (and before that at W1MK) with no legal problems. The amateur regulations at that time had a prohibition against compensation for use of an amateur STATION, but no prohibition against payment for OPERATING.

Along about 1973 or 1974, the FCC changed the wording on some of the regulations in the iterest of "clarifying" them. Yes, you guessed it, the new rules made paid operators illegal. When the FCC realized what they had done, they issued a temporary permission for W1AW to stay on the air.

Then they added new rules allowing paid operators for certain types of amateur broadcasting. (Must transmit on all HF Amateur bands, must broadcast at least a certain number of hours per week, etc.) In effect, this part of the rules was written to legalize W1AW. I haven't checked since the latest rules re-write, but I think essentially the same language is still there.

The reason a larger antenna may make intermodulation problems worse has to do with the nonlinear nature of intermodulation. If, for example, the larger antenna increases the strength of all the signals at the receiver input by, say, 10 dB, the intermodulation products will increase in strength by at least 30 dB. This leads to the standard test for intermodulation: Insert a known attenuation between the antenna and receiver, and note how much the strength of the spurious signal changes.

Intermodulation products will change by more than the value of the attenuator,
while spurious transmitter signals will change by the attenuator value.

I'm SURE that this has been hashed out before, so my apologies. But...
my wife just got her tech ticket, and so I'm in the HT market again.

I've already got a Kenwood TH-25AT (which has since been replaced by
the TH-26AT I believe). It seems to work fine although once in a great
while (about once every three months) it loses it's memory.

Question: does anyone have a recommendation for an HT in the $300 range?
Does anyone recommend the TH-26AT? I'd like to get one that is
physically small like the TH-25AT.

Thanks.... John Kirby

X-Telecom-Digest: Volume 10, Issue 714, Message 7 of 12

>A local news story yesterday gave a disturbing example of how San
>Francisco Police Department sets the priorities on 911 calls. A young

Clayton,

I do a lot of work interfacing with law enforcement on 911 type calls.
And I can tell you for a fact that when a call comes in from a coin
phone the response of the dispatch centers in many cases is "Oh a coin
phone, oh well".

As a result of this I have told my family and friends that if they are
at pay phone they would be much better off dialing "0" and just
screaming for help. The operator will have the number you called from
and the law enforcement people seem to take these call more seriously.

This may sound strange but it seems to be the way it works.

I believe part of the problem is the high amount of prank called by
teenagers to 911 on coin telephones. It's not unusual to see someone
work their way from one end of town to the other dialing 911 on pay
phones.

Don't construe this as an excuse for the S.F.P.D. it's not. It's just
the way the system works.

Pete Lucas G6WBJ pointed out that a Toko helical filter (from DigiKey in the US) will do wonders to put the VHF overloading sources into the weeds, but that putting the 0.7 by 0.5 by 1.2 inch filter in a project box with connectors is more than a little clumsy.. Has anyone thought about making a big rubber duck or a mag mount whip with a filter integrated into the base??? Helluva neat product if it works. (Please send royalty checks to my callbook address hihi.)

I use a home-brewed 1/4-wave mag mount (based on a magnetic mike holder, a chassis-mount BNC and piano wire, from Hints & Kinks), and I suffer a bit of intermod with it on my IC-u2. Maybe I'll try it...

> ...difference... between my 'old generation' Yaesu and Icom HTs and my
> Kenwood TH 26. I attribute most of this to the extended frequency
> coverage of the Kenwood (138 to 174 MHz)... Anyone have similar
> experiences or maybe even hard data?

I have experienced intermods on certain ham frequencies with my Yaesu FT411, picking up paging frequencies around 164MHz. They did not use varactor tuning, instead a wide front end, and a high IF to partly compensate. Here are some details.

Measured sensitivity:

MHz	uV
130	0.25
135	0.2
140	0.2
146	0.2
148	0.22
152	0.22
155	0.25
156	0.4
158	0.4
160	0.8
162.55	1.35
165	2.5
168	7
172	24
174	600

At 147.000: frequency 210 Hz low; deviation 4.2 KHz; tones deviation 3.2 KHz low, 3.3 KHz high (very uniform), but rather "hot" (normal is 2.2 KHz).

Based on 900718 call to the Yaesu 800 number:

The factory modification corrects an intermodulation problem. It changes the IF from 17.3 MHz (he confirmed that our measurement was correct) to 21.0 MHz. Why? The FT411 does not contain varactor tuning because "it's harder to fix, and apparently was cheaper to build it without that feature". (A quote from the guy I talked with: "They're designed and manufactured in Japan, we just sell them here.") Hence the FT411 has a wide RF front end, about 28 MHz, and a higher than usual IF, 17.3 MHz, to "push" image frequencies out of the front end band.

Unfortunately, the IF is just right for a repeater at 145.250 MHz to swamp 162.550, a common weather channel, through intermods. This was the case in Indianapolis, where a powerful wide-area repeater interfered with receiving weather radio channel 1.

Searching my Colorado frequencies database for deltas of 17.3 MHz (plus or minus 5 KHz), I found surprisingly few conflicts...

Was I not tuned in, or has there been no mention of the FCC's proposals for accomodating digital audio broadcasting (DAB) ? The FCC has put forth three possible choices of frequency bands for DAB:

1) DAB somewhere in the 700 MHz region - taken from UHF TV (fat chance!).
2) DAB somewhere around 1700 MHz, taken from aircraft telemetering, with the telemetering moved to 2390-2450 MHz, this band taken from amateur radio.
3) Take the 2390-2450 MHz band from amateur radio and use it for DAB.

This would still leave the 2300-2310 MHz section of the ham band.

This brings me to the deeper question. WHY DO WE NEED ALL THAT MICROWAVE BANDWIDTH??

> My ham interests have mostly been in weak-signal, narrow-band operation. Clearly "my" type of operation doesn't need wide microwave bands, if narrower ones could be kept clear of slop-over from the neighbors.

I assume that ALL non-weak-signal microwave amateur communication will employ repeaters of some type, to get around the line-of-sight or big-antenna problems. As far as band-occupation is concerned, this is a BIG WIN - each QSO uses twice as much bandwidth (or time). (I don't think anyone can seriously fault the use of repeaters on these bands.)

> Assuming a vast increase in interest in digital communication, how much bandwidth is needed for it? What about the W6GN, et al, megabit data limks? Won't they be time-shared among a number of users? I think that the real question lies in how many "digital" hams there will be in any major metropolitan area, and how much information any given user is likely to want to transfer in the average minute. In computer terms, it seems unlikely that the user will "swap" with a central server. The only other BIG digital use that occurs to me is file transfer to/from servers. Today's fancy workstations mostly get by with quite a few connected to single 10 Mbit/s ethernet - even though the boss would have to to pay big salary bucks if employees waited for files. The engineering-design folks now talk about 100 Mbit/s FDDI local nets; but they are also talking about huge descriptions of all the layers/materials in a complex VLSI circuit, or ship, or ....
I have no files (except VLSI chip designs) that are much over 1/4 megabyte.

I think that it's going to be a long time (never?) before many hams deal with computer files as big as even a single layer of a VLSI design.

If you assume that each ham using a file server by radio transfers one quarter-megabyte file each minute, each ham averages about 35 kbit/s. (I don't really believe this much AVERAGE traffic, do you?) These are very one-sided transmissions because it doesn't take many bits to request a file.

Number of hams in an "Area"	Resulting average data transfer
2	70 kbit/s
20	700 kbit/s
200	7.0 Mbit/s
1000	35 Mbit/s

So 1,000 hams in a single geographical area, all simultaneously actively using file servers by radio, would occupy less bandwidth than the threatened part of the 2400 MHz band!! (And we have lots of other microwave bands.)
Please, somebody, tell where I have gone wrong.
Remember, this must be entirely non-business-related traffic.

> The transmission of "human" images, like television (TV), has traditionally been an analog process. And it uses 6 MHz or so per picture, CONTINUOUSLY. A real "win" for band occupation. But compressed TV is already available. Quite good TV can be sent compressed to about 1 megabit per second, and it only gets a bit "jerky" at 300 kbit/s. But at least each TV signal occupies its channel nearly full-time, not bursty enough to allow time-sharing like digital data. TV will definitely need repeaters; doubling the occupied bandwidth. Since it takes two to QSO, a through-repeater contact still only uses one "TV-bandwidth" per participating station.

Number of TV hams active in "Area"	Bandwidth using 6-MHz channels	Bandwidth if TV signal compressed to 1 Mbit/s
2	12 MHz	2 Mbit/s
20	120 MHz	20 Mbit/s
200	1.2 GHz	200 Mbit/s
1000	6 GHz	1 Gbit/s

So, even with a large increase in number of hams due to a no-code license, I conclude that the only ham application likely to NEED all our microwave bandwidth is the transmission of TV images.

Ah, but this civilian owns equipment *normally used for other purposes*
that *will* transmit there in an emergency. And this civilian is smart
enough to recognize an emergency, and even so, to stay out of the way
unless there is a positive benefit to his transmitting. Is this not a
Good Thing?

I've been trying to stay out of the discussion, but my $0.02 worth:

If the situation is severe enough that I would gladly sacrifice my
license, pay a substantial fine, or {insert-favorite-punishment},
then, and only then, would I consider trying to use police/fire/whatever
frequencies if I were able.

I also strongly belive that if the situation were *that* serious, then
thems-who-are-in-power would choose not to prosecute.

My rigs are capable of reception out of band, but I've never bothered to learn if they are capable of out-of-band transmit modifications.

anderson@skvax1.csc.ti.com (John H. Anderson N5OPY) writes:

>>I have been asked for help in contacting a Peace Corp[s] volunteer
>>in Uganda via Amateur Radio. A friend is fearful of his safety.
>>Is there any one here who knows of an amateur in or near there?
>>If you know of an HF voice station, a sched. and freq. would be helpful.

I say "me too", because I have been on the air looking for DX for the last 3 years and have yet to hear anyone on the air from Uganda. I'm not sure if ham radio is not allowed there at the moment, or whether there are just very few licencees and they all keep quiet because of the hordes of US and other DXers that would descend on them. Or else I have just missed them.

So if anyone knows of any activity, please let me know too! (I'd prefer it on CW but phone will do...).

There is considerable activity from several neighboring countries - Kenya, Tanzania, Zaire and Rwanda all share a border with Uganda and have active hams. I'd guess, though, that it might be easier to enquire through the embassy and other routes.

To quantify the rarity of Uganda, it is #41 on the latest list of "most wanted countries" (in the radio sense) that I saw. Perhaps this is an omen, as I need 41 more countries, so statistically Uganda ought to be the next one I find...

I'm not being completely frivolous above, it really is very rare on the amateur bands, and I wouldn't be optimistic about finding any information this way. I would expect the U.S. embassy there to be in daily communciation

with people here, on non-amateur bands (now I'll get flamed by people who
tell me that in an emergency I can use any wavelength I want to - sigh...).

Does ARRL have a lobby in congress. I'm about to get licenced, and I
would like to know if I have an optimistic future in amateur radio. I'm
still considdering the option of illegal configuration, but I hope it
doesn't come to that.

Check back issues of the APCO Bulletin, or symposiums at past NENA conferences.
This problem has NOT been worked out yet for cellular.

{NENA: National Emergency Number Association   }
{APCO: Association of Police Communications Officers}

Phil sez:

Phil sez:
>
> What 7 digit equivalent? Where does it go to?

Tad sez:

The one that you use when you don't want ALI on the call! This is the
number that you use to call something into the city when you are in
the suburbs. In Seattle a couple of examples are 625-5011 and 583-2111.
It is switched through the network, rather than trunked. Because it
doesn't originate at the CO through a TSPS-like trunk, there is no ANI
or ALI.

Phil sez:

>
> It definitely sounds like there is a management problem there. Maybe you
> could get better response through the local TV media. They eat stories
> like that for lunch.

Tad sez:

How typical for rec.ham-radio! This ought to win ham radio a bunch of friends. If the obvious network solution is to program in the 7 digit equivalent to eliminate ANI/ALI, why piss people off by insisting on doing it YOUR way?

MONDAY OCTOBER 15, 1990

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States. It is published every week and is made available for unlimited distribution.

* DOVE NEWS *

DOVE-1 is being reset and re-loaded with new operating software. Here is a recent message by Bob McGwier (N4HY) carried on DOVE's beacon:

DOVE-1>BRAMST <UI>:
DOVE will be reset during the first week of October unless further notice is given here. AMSAT-NA meeting is Oct 19-21 at the Johnson Space Center, Houston, Texas. See you there! de BM.

* SPACE SHUTTLE NEWS *

Mission STS-41 successfully deployed the Ulysses spacecraft from low-earth orbit during its mission last week. Shuttle Columbia is currently being prepared for mission STS-35, which will carry WA4SIR and an Amateur Radio experiment into earth orbit. Columbia had to be moved from launch pad 39B back to the vehicle assembly building due to high winds from tropical storm Klaus off the Florida coast. Baggies were installed on various joints and valves in the main propulsion system in an effort to pin-point fuel leaks. None were found during testing. Launch is scheduled for 01-Dec-90.

* WEATHER SATELLITES *

Spacecraft	Catalog #	Frequency	Status
NOAA 9	15427	137.620	Active-Afternoon
NOAA 10	16969	137.500	Active-Morning
NOAA 11	19531	137.620	Active-Afternoon
Meteor 2-16	18312	137.850	Currently Commanded Off
Meteor 2-17	18820	137.300	Active
Meteor 2-18	19851	137.300	Currently Commanded Off
Meteor 3-2	19336	137.300	Currently Commanded Off
Meteor 3-3	20305	137.850	Active
Meteor 2-19	20510	137.850	Currently Commanded Off
Feng Yun 1B	20788	137.795	Active

* OSCAR-13 NEWS *

Spacecraft magnetorquing is scheduled to commence today. This operation will modify the attitude of the spacecraft and improve solar panel illumination. Mode S transponder operations should return soon after this attitude change is made.

Yes? No! Yes! NO! YES!!!

Well, I suppose you rather watch someone die because you don't think
it is permitted to call help. Ehmm..?

Especially here in Finland, getting a QSO to a fellow ham may be
difficult due to long distances between repeaters - and usually a
police repeater is closer, although that is not certain either. If
there happens to be a ham repeater, there are not always hams there -
consider an accident that happens at 3.30 AM.. The fact that it is
quite uncommon to "happen" to pass by the scene at that hour is not
relevant.

Fortunately, our regulations state the proper procedure quite
explicitly. Not "permitted", but "required". And I figure that would
be a responsibility of ANY innocent bypasser.

Luru

Subject: REQUEST FOR INFORMATION ON LAB TEST EQUIPMENT

I've been given some partially working lab test equipment that I would like to use around the bench at home, but have no manuals which would help a great deal in repair.

If you have manuals for one or more of these pieces of equipment, I'd be more than happy to either pay for the copying at your location or for the shipping to get them to here for copy and back to you.

Here is the list:

```
O'scope, Tektronix model 564B storage scope
     with : 3A1 Dual Trace Amp Plug In
                3B3 Time Base
                3A7 Differential Comparator

O'scope, Hewlett-Packard model HP180D
     with : 1805A 100 Mhz Dual Channel Vertical Amp
                1824A Time base and Sweep Expander

EiP Autohet Counter, Model 351C
     (has panel markings to go to 18 GHz, but someone has robbed
      the first mixer and also the basic counter board, which can
      probably be rebuilt)

Universal Counter, Hewlett-Packard HP5328A with Digital Voltmeter
     and "Universal Module" (what a great name!)
```

Mail, email, phone or fax reply would be appreciated. I'd like to get the stuff working again for ham radio use. Thanks.

John, WB4LNM...

IMHO, this subject hits on the most serious threat to amateur radio; at least when coupled with the economic situation that forces most younger families into apartments or row (town) houses. Why should I get a ham license if I can't put up good-enough antennas to really be able to work much? If my rig/antenna is 3 meters from the neighbor's TV, I'm asking for trouble.

There isn't much that the amateur community can do about the cost of housing, but we (and our League) should do our best in beating back restrictive sales conditions. How??? Dispite the odds against us, the League should keep up its work toward getting requirements for broadcast receiver overload performance.

Just my thoughts ....

|>Larry Lippman @ Recognition Research Corp. "Have you hugged your cat today?"

Larry, I hope that I'm not getting the rep. as a real flamer and arguer
in these
here parts. But, predictably, I disagree. But, let's not take the
extreme case
that has been discussed of jumping on and calling a dispatcher. Let's
take this.

The big one hits the San Madrid fault and half of Southern IL falls in the
Mississippi. I'm home visiting, so I'm there and early on the scene.
The police
or EMS people see my radio and tell me to go stand on the other side of
this big
piece of concrete they're lifting and tell me if I see any casualties.
Now, the
law about type acceptance is not in part 97, so I have to say, sorry I can't do
that. The FCC wouldn't like it.

I think that clearly the FCC wasn't trying to say "Ok, all you Techs get to use
the General CW band if it's a real big emergency." It states explicitly, "any
means of radiocommunication at its disposal." And, to me that means any means.
I think you can replace "any" with "all" or "each and every" and it's hard to
respectably argue that they really mean "some" or "a few of the means at its
disposal." They also contrast these communications with "normal communication
systems." I hardly think that this simply means staying in your license

restrictions. The wording makes it clear that they are talking about something
much more drastic.

This argument is different than the one about calling the dispatcher. Although
that is certainly controversial, I think this one is very clear. Please don't
subvert the ability of responsible hams to contribute to emergency
communications.
Just take the rules for what they say and trust that I'll remember the
other part,
which states that the comms must be about "immediate safety of human
life... when
normal communication systems are not available."

Which is fairer, asking for optional contributions or raising the dues?

Personally,
I think ARRL has been doing a great job for the 33 years I've been a
member. (Guess
that makes me an OF, eh?) However, it takes money to do things, and
relying on dues
alone seems pretty regressive. There's a large range in "ability to
pay" among our
membership, so why not have special funds for special purposes?

I have my limits, though. I draw the line at ARRL Visa cards!

There has been a lot of talk on sci.space about this lately.
They are more interested in (profitably) launching the 77 small
satellites needed to do the job, but you might find
it interesting to tune in.

Oh, isn't this SO typical of the more obnoxious hamcritter on rec.ham-radio. First he DEMANDS that the ARRL board check with HIM before hiring anyone at HQ. Then when someone asks if he had actually proposed this to the league, or if he just got MAD first, he now claims that communication with his director is somehow beneath him....obviously if they aren't reading his mind they must be COMPLETE IDIOTS!

It's not based on power but on features. There are more expensive Harris units in the same power class.

> Just out of curiosity, how old was the gear they replaced? Was it
> rendered unsuitable because of parts unavailability?

That's not an easy question to answer because not all of the equipment was acquired at the same time. Most of the equipment, however, was "homebrew" stuff built in the 60's or early 70's. Some of the homebrew kilowatt amplifiers had been replaced with ETO amplifiers (which were sold off after replacement). The reliability and signal quality of the existing system had degraded to the point where it had to be replaced whether or not the building was renovated.

I'd be interested to hear from anyone running 7 stock amateur kilowatt transmitters 12 hours per day year round. I'd particularly be interested in their experience regarding reliability. That is the basis on which the Harris equipment was chosen over the available amateur equipment, along with a commitment to continued parts availability by Harris and the availability of on-site service should we run into severe problems. I suggest that those who argue that "if Kenwood/Ten-Tec/Yaesu/Icom is good enough for me, it ought to be good enough for W1AW" simply haven't considered all of the needs of running W1AW. (It's also worth noting that all two-way operation from W1AW _does_ use stock amateur gear.)

Frankly, my first proposal was to build a state-of-the-art "homebrew" system for W1AW. Management rejected that proposal because they felt it would take too much of the lab's time. In retrospect, they were probably right: I'm not sure we could have finished the Microsat power control boards in time had we been completely engaged in W1AW renovation efforts. (We _did_ spend a lot of time on W1AW, since we designed and built the signal distribution/interface and control circuitry to tie the system together, along with writing the software to run the thing.) Once we decided to go with off-the-shelf equipment, a request for proposal (RFP) was issued to a number of equipment manufacturers, including all of the amateur manufacturers. The decision to go the Harris route was made on the basis of the responses to the RFP and it was not made lightly. (I should point out that Harris cut us a nice deal, as well.)

Finally, I'd like to point out that the W1AW renovation was paid for with funds freely donated. It's not as though the money came out of your membership dues. The people who donated money did so because they want a first class W1AW. That's exactly what they got.

You're right, it sounds awful. But, if you judge a teaching program
by results only, this method might be construed as good.

I know quite a great deal about services other than amateur radio. I admit to not thinking of CAP, but the person who made the original inquiry did not, in his first or any subsequent message, state that he had any legitimate use for the mod. If he is a CAP member, why not say so?

Because this is not the CAP split... it is (among other things) the Radio Common Carier (RCC) split, to wit:

RECEIVE	OFFSET	TRANSMIT	DESCRIPTION
152.030	+6.460	158.490	RCC1
152.060	+6.460	158.520	RCC3

152.090	+6.460	158.550	RCC5
152.120	+6.460	158.580	RCC7
152.150	+6.460	158.610	RCC9
152.180	+6.460	158.640	RCC11
152.210	+6.460	158.670	RCC13

|> BANDWIDTH??

Because it's going to support all the AR communications when they take
away all the HF and UHF repeater bands!

Seriously Bob, your statements seem very politically motivated than based
in reasons...the impression I get about your basis for spectrum
management is NIMBY...Not In my back yard! You'd like AR to support
your interests in weak signal work. At the same time, your willing
to sacrifice our usage of spectrum to keep yours.

Just waht does the weak signal work contribute to the hobby that makes
it deserve more than other sections of the hobby?

This is indeed different from jumping on any radio of your own accord and calling somebody. In this situation you have been directed to participate in the incident as a communicator.

You don't mention what frequency the person giving this order specifies. On ham frequencies, you would be restricted to those granted by your class of license. (See rules regarding RACES operation.) If you were directed to communicate via non-ham frequencies, nothing in Part 97 applies to the situation because you are being used as a citizen with a radio and not a ham operator.

Don't get me wrong. I agree with the concept. I was objecting to the juxtaposition of the two announcements. My natural response would be, "why don't you use the money you were going to spend on these people's salaries, especially since the Board also authorizes these new positions to hire their own support staff."

Your reasoning was quite interesting. I tend to agree with your conclusions. I just hope some nitwit with nothing better to do doesn't decide to pester the FCC (or anybody else) for a ruling.

> Telecom-Digest today:

They aren't kidding about the prank calls. In the dispatch center where I worked (Rochester, NY) calling from a pay phone was one of the criteria for reducing a fire assignment due to the high probability of being a false call.

It isn't just the dispatchers that react that way. Listen to a police officer's tone of voice when the dispatcher informs them that the call they are on originated from a pay phone.

> bandwidth is the transmission of TV images.

It does seem to be the logical candidate among the KNOWN modes. Or how about spread spectrum? Are there any calculations available on how many hams using spread spectrum technology could occupy xxx MHz?

It seems strange that FCC may be considering reallocation of spectrum for another wideband mode when their emphasis lately has been on increasing spectrum efficiency through better narrowband technology.

Yes! This is the reasonable viewpoint. Owning and modifying radio equipment for out-of-band operation is not IN ITSELF illegal. Contrary to the apparent tone of some of my earlier messages in this thread, I am not against the mods, but rather the frivolous USE of the modified radio.

If people would just keep in mind that they could be held accountable for their actions (whatta concept), maybe there wouldn't be so much anguish and irritation over illegal use of radio gear. The use does occur, so obviously the users are not using their heads.

> Alan, N0MFW (owns a potentially illegal HT)

Lots of things are potentially illegal. Whether your HT actually becomes illegal is up to how you choose to operate it.

Maybe we can convince the FCC to redefine "crossbanding" or at least reduce the restrictions on its use.

Earlier in the week I was lurking in a parking lot in a seedier part of North Hollywood. I noticed a car with what appeared to be a base loaded HF antenna. So I crept up for a look. Yup, nicely built base loaded job - far too snazzy to attach to my chariot. I took a closer look, it had a label with a brand name. The antenna was called "The Modulator"

Now isn't that amazing seems that all that work people have done with microphones, audio filters etc has been wasted. The key to decent modulation is in the antenna. It said so right there on the label. But this does leave an important question:

Could this antenna be used for CW? We all know that CW stands for Continuous Wave, which is unmodulated carrier. How about that, a no-code antenna. Think I'll get one of them things even if it will outclass my car.

We now return you to "If I'm dead can I call the cops on my radio?"

John,

I have a TH-26AT and I am very much satisfied with it. It has performed mostly without a problem so far. Since you already have a TH-25AT, you could take advantage of the similarity between the two models for key accessories such as battery packs, speaker mikes and so forth. Because this was my first HT, I was a bit puzzled about intermod problems I experienced. There has been alot of discussion on this topic within the rec.ham-radio/info-hams net. The TH-26AT does have extended receive frequency range so there are broadband rf circuits. I think this intermod problem is symptomatic for these kinds of rigs regardless of manufacturer.

Good luck in your decision. I thoroughly enjoy my TH-26HT.

73s
Pete

(Robert Carpenter):
>
> This brings me to the deeper question. WHY DO WE NEED ALL THAT MICROWAVE
> BANDWIDTH??
>

AMSAT (worldwide AMSAT, not just AMSAT-NA) is planning to put a new satellite in this region which will occupy a Mhz of space. The problem with their proposed move is that we have satellites in the proposed spectrum NOW that admittedly don't occupy all of that but do occupy some of the frequencies. There is PACSAT, DOVE, and AO-13. The very life of AMSAT's proposed future projects, those we have funded and are doing engineering on, lie in the 2400-2410 region. If they leave that alone, they can have 2410-2450. Of course, what they REALLY want, is the lower ten Mhz to get away from the increased C/N they will have to have to get over and above Microwave ovens. AMSAT intends to go down flaming on this proposal. It is yet another nail in the coffin of any real advancement in amateur radio. The ever presnt pressure on our spectrum will be the end of the hobby for all who wish to do packet, satellites, Wide Band TV. We have 70cm threatened by Wind Shear radar (DAMN nature for making the natural wavelength of the vortices correspond to 70cm), L band threatened by land mobile, S band threatened by land mobile and DAB. The only reason our higher frequencies are not yet heavily threatened is that the devices for using them are still to expensive. I am VERY despondent by our outlook because of our seeming complacency, apathy, lack of monetary resources to do battle with these spectrum pigs, and lack of political clout in Congress. No matter how much I disagreed with Goldwater's politics, he DID defend amateur radio against all comers. We are sorely in need of a replacement. Bob, I think this answer was more than you requested or is it?

Bob

I alway's thought that playing games real-time or else
batch style mode would be fun. Would anyone out there
be interested in playing Stellar Conquest ? I think
it would be fun, but a move might take a long time, like
maybe two weeks. How about chess, or checkers ?

Jeff

In article <9010112228.AA02460@cmr.ncsl.nist.gov>, rc@CMR.NCSL.NIST.GOV (Robert
Carpenter) writes...
>This brings me to the deeper question. WHY DO WE NEED ALL THAT MICROWAVE
>BANDWIDTH??
>
>> My ham interests have mostly been in weak-signal, narrow-band operation.
>Clearly "my" type of operation doesn't need wide microwave bands,
>if narrower ones could be kept clear of slop-over from the neighbors.

>> Assuming a vast increase in interest in digital communication, how much
>bandwidth is needed for it? What about the W6GN, et al, megabit data
>limks? Won't they be time-shared among a number of users? I think that the
>real question lies in how many "digital" hams there will be in any major
>metropolitan area, and how much information any given user is likely to
>want to transfer in the average minute.

The key is not average per minute, over time. It's average during the time that you're willing to wait for a response. In batch mode, next-day results, you can average over a day. Interactive applications require averaging over milliseconds or seconds.

>If you assume that each ham using a file server by radio transfers one quarter-megabyte file each minute, each ham averages about 35 kbit/s. (I don't really believe this much AVERAGE traffic, do you?) These are very one-sided transmissions because it doesn't take many bits to request a file.
>
> | Number of hams in an "Area" | Resulting average data transfer |
> |---|---|
> | 2 | 70 kbit/s |
> | 20 | 700 kbit/s |
> | 200 | 7.0 Mbit/s |
> | 1000 | 35 Mbit/s |
>
>So 1,000 hams in a single geographical area, all simultaneously actively using file servers by radio, would occupy less bandwidth than the threatened part of the 2400 MHz band!! (And we have lots of other microwave bands.)
>Please, somebody, tell where I have gone wrong.
>Remember, this must be entirely non-business-related traffic.

Okay, you've gone WAY wrong.

First off, you have to translate the digital to analog (bandwidth) domain. The ratio is a cost tradeoff. Fairly cheap (FSK, 2PSK) radios will give you about 1 Hz/bps or worse; the absolute worst possible results, of course, are obtained by acting like 2 meter TNC users. But higher efficiency costs a bit more; 6 bps/Hz is possible, but you have to be the phone company to afford it.

Second, what is the latency we're tolerating? We do a lot more than transfer files with our computers, and would like packet radio to be like that. NNTP (news protocol that we're using now) polls each article from the server to the reader when you ask for the "next" one. How long do you want to wait? At 1 Mbps, it's pretty good. At 1200 bps, it's hopeless.

Should I even begin to mention remote graphics like the X Window System, which require interactive speeds in the 64 kbps range to be useful? It's not the average over the day, but the latency per message, that counts.

Also, a 10 MHz band is too small for repeaters. If we had two 10 MHz segments about 80 MHz apart, it would be a lot easier to separate the input from the output, in the 13 cm. range.

> The transmission of "human" images, like television (TV), has traditionally been an analog process. And it uses 6 MHz or so per picture, CONTINUOUSLY. A real "win" for band occupation. But compressed TV is already available. Quite good TV can be sent compressed to about 1 megabit per second, and it

>only gets a bit "jerky" at 300 kbit/s.

That's not exactly true either. If you're talking about "teleconference" video, the "talking heads" application, then you're right; for maybe $20-30k, you can compress down to 256 kbps and be only a little jerky. (That's hardly an ATV price range.) But "full motion" video, equivalent to a 6 Mbps analog channel, takes about 45 Mbps with minimal compression and probably several Mbps if compressed optimally. That's when you have real moving pictures, like the broadcasters use, and not just faces against a backdrop. Try watching a western through a compressor...

Clearly the 2300 MHz band is a ripe target for plucking. Few hams use it. But that doesn't mean we should be happy with microwave sliver bands.

Perhaps I should have been more explicit. You can set whatever offset you like, down to 5 Khz, for VFO setting. But my question was really involving the reaching of repeaters running at odd T/R offsets (e.g. other than 600 Khz in 2m). As far as I've been able to determine, the IC24 won't let you set the T/R offset for repeater operation in other than 25 Khz steps. For example, in the Los Angeles area, there are at least 2 repeaters with offsets that aren't an even multiple of 25 Khz.

Does anyone know of a trick to get a non-25 Khz multiple offset into the IC24 repeater offset setting? Thanks.

I thought it might be of general interest to many of you if I made the announcement of a new Conference - The Microwave and RF Forum. Accessable directly from RES-Q (tm) (201) 881-7421.

(Also available as Group Mail from 9:100/9 & 9:833/7 as MW_RF)

MW_RF is made available by Compact Software, Inc. soley for the purpose of furthering knowledge within the Microwave and RF community, [and my assurance of no commercialism].

CSI designs CAD/CAE software for all phases of design and development, so there are many engineers here who would enjoy the opportunity to participate in roundtables and such...

If you are interested in bringing a forum such as this to it's feet, ask your local SysOp to obtain the Microwave and RF Forum.

Bill Kreps, SysOp of RES-Q (tm)

Subject: 902-928 Megahertz Band Automatic Vehicle Monitoring Systems (AVM)

This weekend there was a spirited discussion of new band plans for the 33 cm amateur allocation, including a review of the recently adopted Southern California Repeater and Remote Base Association plan. A motion to adopt this plan for our area was tabled for, among other things, a lack of information on what frequencies would be used for the Automatic Vehicle Monitoring systems that have recently been approved by the FCC for this band. Additionally, the amateur allocation has a secondary status to the AVM, so we must stay away from whatever frequencies are chosen for it.

In the SCRRBA plan, 903-912 and 918-927 megahertz were set aside for AVM usage in southern California, resulting from a meeting between members of that group and ITS/PACTEL in January 1990. The question that arose at our coordinating committee meeting yesterday was if the ITS/PACBEL usage of these frequencies is nationwide, or does it apply only to southern California ? Secondly, what is the timetable for these systems to be deployed in the Baltimore-Washington-Philadelphia corridor ? Lastly, who is (are) the commercial licensee(s) for the system in this area ? Also, we'd like to get some technical info on how the system works so that a prudent band plan could be developed.

Any information that you could provide on the preceding questions would be of great assistance. Please respond either directly or to the mailing list. I'll summarize in a few days if the volume warrants. Thanks very much. 73

John...

I had a chat with the head of the local plainclothes squad about LoJack the other day; a few interesting facts:

Most thieves will take the car, park it out of the way, punch the trunk and grab what they can. The car will be abandoned well within an hour of theft.

Those looking for parts will often park the car in an out-of-the-way spot and come back for it later- like at night- before stripping it. LoJack might get it first, in this case.

Basically, my friend said, LoJack is for the insurance companies, who'd rather pay for a few locks on a car (minus your deductable, of course) than for an entire car.

He also mentioned that my car, with 4 antennas, two radioand call sign plates was more or less calling out "steal me! steal me!", but that's another matter, I suppose....

This latest thing about the code test absolutely amazes me. Now, not only do have to copy the code, but you have to do it THEIR WAY! This is ridiculous in the extreme. If I were ever refused a license for that, the poor guy who did it would wish he had never heard of me by the time I got through with him. I'd report him to every agency I could think of. This is way outside the parameters defined by the FCC. All they say do is COPY it, they don't say how. All Part 97 specifies is that you have to do it by ear. Not words, not letters, just hear it and interpret it. The method is up to you.

As for the poor misunderstood volunteer, I have no sympathy. He does NOT have the right to do that. All he is doing is practicing the same exclusionary elitism that is ruining this hobby. He (or she, whatever, you know what I mean) deserves any good public squashing that you can do. Report him to the VEC, the FCC (probably more productive, VEC's tend to have different attitudes, don't get me started on that), and the ARRL. Make sure you can prove that you did copy the test correctly. If the VEC doesn't override his decision, go to the FCC. Produce the same evidence. You should at least be entitled to a test before an FCC examiner. The FCC examiner will not care how you do it. I personally would not be satisfied until I had ensured that the VE in question never gave another exam in his life.

If this kind of crap is going happen, then bag the VE system and go back to the old way. I would even be willing to bet that if a lawsuit were ever filed based on this, the FCC would insist on that. I do feel very confident that the FCC would retest any applicant who was rejected because of this. They want to flush the code requirement anyway.

I'll entertain any and all flames. In fact, i'll enjoy it! Please do by all means.

K6LFH SILENT KEY

HR AMSAT NEWS SERVICE BULLETIN 279.01 FROM AMSAT HQ
SILVER SPRING, MD OCTOBER 6, 1990
TO ALL RADIO AMATEURS BT

The Amateur Radio Satellite Program lost one of its early pioneers and strongest supporters when Chuck Towns (K6LFH) passed away on September 28th at his home in Los Gatos, California. A memorial service was held on October 5th in Saratoga, California.

Chuck was one of the founding members of Project OSCAR and was very active with the first several amateur satellite projects in the 1960s. He continued to promote the amateur satellite program until his passing. Many amateurs in the San Francisco Bay Area became active on amateur satellites because of the support and help Chuck provided.

[ANS would like to thank WB6GFJ for the information in this bulletin.]

New AMSAT-NA Board of Directors Elected

AMSAT-NA Headquarters has announced the results of the recent Board of Directors election. The following candidates were elected and will serve for a two year period in accordance with the Bylaws:

1) Tom Clark (W3IWI)
2) Doug Loughmiller (KO5I)
3) John Champa (K8OCL)

Elected to serve as First and Second Alternates to the Board are candidates Junior De Castro (PY2BJO) and Joe Kasser (W3/G3ZCZ), respectively. Alternates will step in to fill any seats on the Board which occur as a result of a resignation before the next Board is seated in the fall of 1991. AMSAT-NA would like to thank all those members who took the time to cast their ballots. The new Directors will serve beginning with the annual AMSAT-NA Board Meeting which starts on Oct. 19, 1990 in Houston, TX and will be present throughout the AMSAT Space Symposium, available to discuss issues with the attendees.

FO-20 UPDATE/SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 279.04 FROM AMSAT HQ
SILVER SPRING, MD OCTOBER 6, 1990
TO ALL RADIO AMATEURS BT

Latest Japanese Bird Still Experiencing Temperature Problems

The FO-20 Command Team at JARL report that FO-20 is continuing to experience high temperature problems which is forcing a drastic reduction of operations on the bird. Unfortunately, because FO-20 is currently experiencing a period of eclipse-free orbits, the natural cooling off of the satellite during eclipse is not occurring. Therefore, the reduction of transponder operation availability is one way to reduce the internal temperature build up. As of the weekend of 29 Sept 90, the battery temperature had risen to near 45 degrees C. Extended exposure to high battery temperature will decrease the useful life of the battery.

Although it is subject to change at any moment, this list is the current schedule of operation for FO-20:

From		To		Mode
08 Oct 90	0920	08 Oct 90	1110	JA and JD
11 Oct 90	0825	12 Oct 90	0850	JD

The above dates and time are in UTC.

The FO-20 Command Team will be monitoring satellite performance and operations during these times and may turn off the transponder if they determine that the satellite is in danger.

[ANS thanks the FO-20 Command Team and WD0HHU for the information in this bulletin]

SB ALL @ AMSAT $ANS-279.05
OPERATIONS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 279.05 FROM AMSAT HQ
SILVER SPRING, MD OCTOBER 6, 1990

TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule Announced

AMSAT Operations Nets are planned for the following times. Mode B nets are conducted on an AO-13 downlink frequency of 145.950. Mode J/L nets are conducted on an AO-13 downlink frequency of 435.970.

Date	Phs	mode	UTC	NCS	Alt.	U.S. day
9 Oct 90	172	J/L	0015	WD0E	WB9ANQ	Monday
- 15 October 90 reorientation to 180/0 -						
21 Oct 90	98	J/L	1800	WB6LLO	W5RRR*	Sunday
27 Oct 90	135	B	1300	WB9ANQ	KA5SMA	Saturday
03 Nov 90	98	J/L	1500	N5BF	WD0E	Saturday

* Most NCS operators will be at the AMSAT Symposium at JSC in Houston, TX on 21 October 90. As a result, this net may be cancelled.

Nets are scheduled for North American geographic coverage and time zones, although other parts of the world are often within the footprint and checkins from everywhere are welcome. Those who don't have adequate and convenient coverage from this net are encouraged to schedule their own nets via AO-13. Write to AMSAT Headquarters with your schedule and we will run it in ANS.

For information on the amateur satellite program and how you can participate, contact AMSAT-NA Headquarters at P.O. Box 27, Washington, DC 20044, phone (301) 589-6062, or contact your local AMSAT Area Coordinator.

AO13/AO10 TRANSPONDER SKED

HR AMSAT NEWS SERVICE BULLETIN 279.06 FROM AMSAT HQ
SILVER SPRING, MD OCTOBER 6, 1990
TO ALL RADIO AMATEURS BT

A new Transponder Schedule for AO-13 was put into effect on September 8 which is planned to continue through October 17.

Mode S operation has been eliminated for the time being since relatively poor solar panel illumination does not allow sufficient power for proper battery maintenance during Mode S and S/B periods. Satellite reorientation (a.k.a. magnetorquing) is scheduled to commence on October 15 and once it has been completed, it is expected that Mode S will be returned to service.

The present transponder schedule for AO-13 is as follows:

Mode-B : MA 003 to MA 165
Mode-JL : MA 165 to MA 195
Mode-B : MA 195 to MA 240

Off   : MA 240 to MA 003 (Mode B Beacon On)
Omni Antennas   : MA 240 to MA 060

The September 10 attitude estimate is:

BLON = 205 and BLAT = -7

AMSAT-OSCAR-10 appears NOT TO have been receiving sufficient solar panel illumination to support Mode-B transponder operations. Both beacon and transponder signals show signs of FMing. Until further notice please DO NOT use AO-10's transponder.

It is expected that AO-10 may once again receive sufficient solar illumination to support Mode-B transponder operation by sometime in November.

AMSAT SYMPOSIUM, PART 1

HR AMSAT NEWS SERVICE BULLETIN 279.07 FROM AMSAT HQ
SILVER SPRING, MD OCTOBER 6, 1990
TO ALL RADIO AMATEURS BT

The Date for the AMSAT Symposium is Drawing Near

There is not much time left to make your plane and hotel reservations for this year's AMSAT Symposium which will be held during the weekend of October 19, 20, and 21 at the Johnson Space Center (JSC) Visitors Center.

Presentations will be held in the Visitor's Center Auditorium, and have been scheduled for all three days of the weekend. The talks have been scheduled in serial alignment so that you will not have to choose between two talks at any given time.

Friday's talks, which begin at 3:00 PM include: Satellite Image Processing for the Amateur, AMSAT-NA Education Activities and finishing with AMSAT Orbital Data Management. Saturday's activities begin at 8:00 AM. A scan of the program lists talks on such topics as:

The Decoding Telemetry from the Amateur Satellites
In-Orbit Performance of 4 Microsat Spacecraft
A discussion of AO-13's Orbit
A report on the Phase 3D Project
Phase 4 Technology as it Applies to Phase 3D
Macromets and Microsats
A Pacsat Demonstration
Microsat Motion, Stabilization, and Telemetry
Full Motion Digital Video Via Amateur Satellites
SAREX Hardware for STS-35 and 37
Astronaut Deployable Satellites
Webersat Operations and Experiment Results
AMSAT-NA Operations Organization
The Development of 2 DSP Modems

Regular tours of the Johnson Space Flight Center will be available throughout the weekend.

SB ALL @ AMSAT $ANS-279.08
AMSAT SYMPOSIUM, PART 2

HR AMSAT NEWS SERVICE BULLETIN 265.08 FROM AMSAT HQ
SILVER SPRING, MD OCTOBER 6, 1990
TO ALL RADIO AMATEURS BT

Saturday evening's activities will be held at the JSC Employee's Recreation Center with the ever-popular Attitude Adjustment Hour followed by a Texas Bar-B-Que Dinner. AMSAT is very fortunate to have as its Guest Speaker Mr. Aaron Cohen, Director, Johnson Space Center. Following Mr. Cohen's address the AMSAT-NA Annual Meeting will be held.

Sunday's activities begin at 9:00 AM and the topics to be presented will be: Getting Started in Amateur Satellites, Building a Versatile Homebrew Satellite Ground Station and Poor Boy Satellite Station. For those who can delay their departure time until late Sunday, there will be a chance to attend an open house (starting at 1:00 p.m.) at the world's largest amateur antenna, W5UN, the station that brought DO-17 (Dove) back to life.

When making airline reservations, please note that Hobby Airport is MUCH closer to JSC than Houston Intercontinental Airport. Contact AMSAT Headquarters at 301-589-6062 for further information on Symposium registration and accommodations.

I went to More Intercept Operator School (058) for the Army more than 30 years ago. Code was only 4 hours a day. The school was about 4 months long. In less than 2 months I was at 15 WPM on the mill, 20 WPM with a pencil and 25 WPM with a ball point pen. The pen has lower friction so I could write faster. I had typing the other 4 hours and the best I could do as 13 WPM. I can do a little better now using two fingers. I have 0 music ability and very poor finger coordination, most anybody can learn code if they try. No one failed the school due to lack of code speed. I am sure that I could have gone much faster if I could transcribe it. I heard 50 WPM tapes and they didn't sound all that fast. I knew people who could transcribe 100 WPM code while reading a book and smoking a cigar. I heard of people who could transcribe 60 WPM Baudot code (RTTY)

In the WRTC last July, all contestents use a 100W transciever. They could cause splater and have bad audio, but I did not hear any. Both SSB and CW were used, I wish there was some RTTY also. The USSR has had radio sport competition for a number of years, and fox hunting I understand is quite popular in Europe. Lets not be a wet blanket and have a positive outlook on the radio sport competitions. I personally think it is a great idea and can be a lot of fun. And if we have the competitions and the average joe becomes interested in the "sport", who knows, we might even start to get some young people to become interested and want to join. Lets have a positive outlook and support the positive aspects. I am sure we can put resonable limits on the sport to prevent the use of large linears, rude habits, and other socialbily unacceptable behavoir.

> Are you outraged at ME because demonstrating the use of hand signals is
> still required on the drivers exam? Are you outraged at ME if you go to
> engineering school, and are required to take some liberal arts courses?

Of course not.

First of all, you might need to use such hand signals if your signal lights fail, and you might need to interpret these hand signals if you encounter someone on the road whose signal lights have failed.

Now I know someone is going to immediately be willing to say something about "what if your microphone fails" or "what if the other guy can only send CW". Let me put these potential arguments to an early rest.

UNLIKE the open highways where you do NOT have a choice in who you have to deal with, on the radio you can choose who you QSO with, and what modes you even want to use. You do NOT need to be prepared to communicate with EVERY ham there is.

In an emergency situation, there is usually going to be SOMEONE on some frequency that some transmitter can transmit on. It isn't necessary for EVERY ham to be able to communicate in every mode and every frequency for emergency purposes. CW might be used in an emergency, but there will be enough hams around who can copy it as witnessed by the large number who tell us how much they love CW and Morse Code.

Tad, when you speak of engineering school, are you talking about one of those 4 year extended trade tech schools, or a 4 year University?

The latter does require liberal arts courses, as that is their tradition. The former does not. However, the latter is not telling the former that they have to. If you are considering an education in engineering, and if you don't want to even take any liberal arts courses, then I am sure you can find some program that will let you do it your way.

Ham radio does not yet give you a choice. There are 5 license classes and not ONE can be earned without having to bow down to demands of the Morse Code traditionalists and learn something the candidate may or may not be interested in.

If you graduate from an engineering school without having taken any liberal arts courses, you may not be able to get a job. The reason is that the skills and understanding of human nature, life, and society, as taught in these courses, is essential for even engineering work in every engineering field. You need to understand the thinking of people who use what you design. You need to be able to communicate with the people you work with. If you can get that ability some other way than liberal arts courses, then that is fine. If I were hiring for engineers, and one came along who did not have any liberal arts courses, he would not be hired by me unless he could show that he had the necessary capabilities learned through other means (and "life learning" is ok, too).

The point is, although liberal arts skills are really needed in engineering careers, you are not forced by law to take such courses just to get an education, because you can choose to educate yourself any way you want.

There is no way to get use of the radio spectrum for hobby and experimental purposes without bowing down to someone else perception of what is needed that cannot be proven to (any more) actually be needed.

I am not outraged at you, Tad. I am just disappointed you could not come up with a better analogy to the situation with ham radio.

> Fairly recently, I was in favor of some kind of Morse-free ham exam. But
> now I am not so sure. I'm not so sure that the code test is too tough
> anymore, and I wonder if we really need to eliminate the only demonstration
> of operating skill on the exam.

I'm interested in what changed your mind. Do you think that the code test was easier than you once thought? Let me put this to rest. The code test is BLATANTLY EASY. I learned 5 WPM to get my Novice exam in just 6 hours of study. If I were to place a value on my ham license based on the study and effort I put into (which I do NOT ever do) then I would have to consider it to be WORTHLESS. But don't worry; I base the value of my ham ticket on the benefits it can bring me, not on how much effort I put into getting it. I look FORWARD to assess values, instead of backwards.

Another point I would like to bring is whether or not we really need to even have candidates demonstrate so much operating skill. Not all hams are going to be doing the kinds of things where personal operating skills, such as CW, or any of the other techniques that are people-based. Some could well be interested in experimenting with technical things only. Others might be more operating oriented than the techies, but be only interested in local VHF/UHF communcations, where their speaking skills will work better.

If we need operating skill tests, why not have ones that test what most hams really do most. If we cannot decide and agree on what that is, then let each of us choose and be limited to using what we choose to test on.

> I keep running into folks (in person, not on rec.ham-radio) who have some
> kind of interest in ham radio, but say they can't learn the code. After
> further questioning, my suspicion is that they have never really spent
> any time and effort on it. There are a lot of folks who have a 2 minute
> attention span. I have a feeling that if we eliminate one part of the
> exam, there will still be folks complaining about the other part.

There always will be people like that. A few of those people might not have correctly identified why they don't like Morse Code. A few more might not be properly motivated because they expect ham radio to be something that they have to actually USE Morse Code on. A few more still might not actually be able to learn Morse Code. And finally, there are some who are NOW, and even under FCC proposals to fix this proplem, STILL WILL be excluded from ham radio because they cannot copy code by ear at all (and some of them can do so by watching a blinking light).

> The tests have slowly become easier and easier in the years since I
> passed my Novice as a 12 year old in the mid-1960s. I believe that
> there will always be pressure to make the tests easier. When do we
> stop?

Part of the pressure to make things easier is because the code test is present. And the tests are also easy because the process of selecting the questions to test on is not as advanced as it should be. Further, even many of the WRITTEN exam questions are no more applicable to what most all hams need to know than the code test is.

Proposals have been suggested on this newsgroup and elsewhere on how to go about fixing the written exams.

1. Each question will apply to the BASICS of radio operation, radio theory, rules and regulations, and safety, that is applicable to the general use and cooperation of sharing a spectrum resource.

2. Technical questions shall be generated by computer using a published algorithm freely available to the public. This algorithm shall, for each question, generate 1 from a wide diversity of possibilities. For technical questions that include numeric calculation, the range of numbers chosen shall be very wide. No question shall have fewer than one hundred forms possible. Same may have more than a billion.

3. Questions on FCC Rules shall be written to assume that a copy of the actual current rules is on hand for the test taker during the test. Publishers will surely jump on the opportunity to publish a copy of the rules as a separate booklet. It will be the responsibility of the candidate to bring the rules booklet, and the VE will verify that it contains no other material or notes.

Once the rules are cleaned up and made applicable, a step not likely to take place until after the code issue is resolved in favor of having at least one codeless class, then the pressure to ease the tests will only come from those not really qualified to share the spectrum.

But remember, we are to be testing on the competency to use and share the radio spectrum, not on how much someone can "be like us".

> of evil conspiracy to drag us back into the 1950s.

I don't concur fully with the outrage. Though I don't have the original posting on the screen at the moment, I do recall an inference in it that everyone should have to take the same test, because it was easy for one person. When I originally read that, it was weak enough at the time to not be worthy of a rebuttal. It is the subsequent spark of debate that my rebuttal is addressed to.

> >
> > My answer is NO, if I have two meters available, and YES if there is no other means of communication handy.
>
> This is a different situation indeed. Speaking as an experienced police dispatcher, I would say that the department would wonder why the ham insisted on using his/her own radio for something that urgent. Calling for an "officer down" or "officer in trouble" is probably the most urgent call you could make to a police department (by their standards). Certainly it would justify ANYONE'S use of the patrol car radio.
>
> On the other hand, it is quite silly (yes, I've heard it done) to autopatch an accident report with emergency units already at the scene.

Those are good examples of the extremes. I would not hesitate to use the police radio (assuming it is functional and accessible) to call in the "office down" report. Regardless of my location in the United States. In a foreign country, there would be hestation, as the laws in those country are "foreign" to me, and I don't know what severe trouble I might be getting into. I'll suggest that readers outside the US post what they might think could happen in their countries in these kinds of situations. I would be interested, too, in cases where the native language us not English and the passerby is in such panic, they cannot recall any of their Berlitz tapes to use anything but, say, English.

Still some people might be intimidated by the police radio, or afraid that they would not be believed, or whatever else. If they have another means of communication that are already familiar with anyway, they might still prefer using that. Quite likely it would be faster for the average person to use 911 on his cellular phone than to use the officer's radio, anyway. Panic will set in for many people, and using the police radio might require them to think more about how to do it, than to just do what they already know how to do.

The latter example is certainly the absurd case, but I've known people to do such things, and would very well believe it to have happened.

I guess I could be just as absurd back to that person and ask them why they didn't just go tell the police officer (or other emergency personnel) who where right there, in person.

In the regulations concerning amateur radio license and radio traffic, it is quite clearly said, that in a serious emergency (where human lives or considerable amount of public or private property is on stake), anyone is REQUESTED to do ANYTHING to get help on the way. I teach this way on a novice course, too.

I presume this would include "modified" ham radio gear and police repeater frequency as well. Before they go digital (not likely in a few years' time) or use scrambling (not common here), I would also easily think of several situations where this would be the best way to call an ambulance, for example. Remember, sometimes seconds DO count. However, I believe that an emergency call on 2 meter repeater would be faster - it would almost certainly take A LOT of explaining to the police radio operator to convince them. But that would be ONE possibility. MUCH faster than to run and look for a phone - say, from an accident site on a highway. Not everyone has a cellular phone in their car yet.

A whole other thing is to misuse the equipment. As far as I know, there was a ham (should I call him that?) in this town who got caught of chatting with the cops with his IC-2GE. Apparently, he was seriously drunk (getting caught almost requires that, I think).

He was facing charges of "Serious disturbing of security traffic" (or whatever that REALLY is in English) and possession of illegal radio transmitting equipment.

The point here is, that the latter charges were dropped - or at least they tried to get them dropped - on the basis of the fact that radio amateurs are permitted to build their own equipment, if desired. Thus, the modified IC-2GE would be a mere subject of his construction project... Remember, ham gear don't have to be type approved, if it is not meant to be sold.

Well, what's the bottom line? I am sorry to say that I don't know. The details of his case are unknown to me. I heard this from a fellow ham who was asked by the poor guy's attorney (as far as I understood it) to help with the case. I don't know how it all came out - or even if it there has been a trial yet.

Better hit the 2 meter repeater if you're in Oulu :-)

I seem to remember some time ago some discussion about GM radios that, if
one turned them on with certain buttons held in, that shortave reception
was enabled. Does anybody remember that discussion and still have the info
?
Also does anyone know of similar ocourances on other brands of car radios ?
I friend and I just thought of this again at lunch time. We will be
pressing and twidling the knobs on our radios to-night. If we get any thing
other than sore fingers I will let you know
.
Cheers and 73's

Maybe ICOM found a way to keep you from unlawfully using your non-type-accepted amateur equipment to transmit outside the ham bands.

well, it seems to me, Civil Air Patrol repeaters frequently straddle the 2m
band; they don't seem to mind "modifed ham gear" vs. type accepted, and to
my knowledge this is not unlawful; no I am not an attorney, but quite a few
CAP types here in Austin are also hams, and go this route, so I think we may
not wish to assume dt there is looking for a means to an unlawful end.

cheers

There seems to be a misunderstanding about the BA-12. It has NOTHING to do with the fast charger. The BA-12 is a little voltage/current regulator which slips ontop of an external battery pack (e.g. BA-90) to allow you to charge it using the supplied wall charger (at normal charge rates).

When I was a new ham, I tried to call 911 to report a shooting. I tried every repeater I could hit & found noone that could place the call. Of course, it was about 2am. I agree that we should standardize 911 repeater autodials, even if multi-city boundaries may life tough on the 911 operators.

The other option is to suggest that all hams should carry cellular phones to make emergency calls. Really says something about our usefulness doesn't it?

Having recently purchased a Swan 500CX, I'm now in need of a manual and
schematic for the unit. Does anyone have a copy or a repro that they
would be willing to part with?

I know that Swan is long gone, but does anyone know who purchased them
or where their old parts stocks went?

tnx es 73, Fred   AA7BQ

>bray@sun.soe.clarkson.edu

I will agree with Mr. Bray that there is some misunderstanding abou the
BA12, however the misunderstanding is on his part best I can tell :-)

The BA12 that I own will not fit atop any of the battery packs that I own.
In fact, the BA12 is necessary to use as an adaptor so as to charge the
internal batteries carried by my R1 when I use the fast charger. When I
buzzed out my BA12 (which by the way is marked "battery adaptor"), I
found it to be a simple passive circuit, ie straight through connections.
There is no means provided to connect the R1's wall charger to the BA12
either. Furthermore, when my external battery pack is attached, the
internal batteries cannot be charged via the fast charger.

I don't own an ICOM, though I've heard they're very good units. For what it's worth, I can say that the Kenwood TH-75A solved the problem by providing three "special" memory locations which can take oddball splits (out of a total of 10). You use them by 1) programming the memory normally, thus setting the receive frequency, then 2) dialling up the transmit frequency, pressing the memory button, pressing and holding the PTT switch (unit doesn't transmit in this case), and pressing the same memory channel number. This saves the transmit frequency.

It might be worth trying this out on the ICOM on the off-chance that it can store separate TX and RX freqencies in at least some of its memory locations, documented or not. (Hi, Lauren! Good luck.)

The thing that clips onto battery packs and that you plug the wall trickle
charger into is called the AD-14. They're pretty scarce, I imagine because
demand for them is huge..

  Chances are that the transmitter is well within FCC specs.  It's not
  unusual for a paging company in a metro. area to run 15 or 20 transmitters
  all belching out 250 Watts in simulcast.  If your DC-to-Light HT doesn't
  like that, then there is probably no where to hide.  Only once have I seen
  the intermod generated in the transmitter instead of the receiver.  That
  was when the isolator load had blown open at a site co-located with
  other transmitters.  If you can back up your claim with proof you might
  get the company to listen to you.  Things will happen a lot faster if
  you can get the FCC field office to make the call for you!  I speak from
  experience!

Yeah, REALLY! There is a local pager that gets into my TH-215 *TERRIBLY*
making it unbearable to passively listen to one of the local repeaters.
I had problems with intermod from a digital paging system when I lived on
Long Island, too, right smack on a packet channel.

WHY are these things such a problem? It seems almost universal that they
throw all kinds of crap everywhere. Numerous letters have been fired off
by me, but none of these companies have ever responded. Are the FCC regs
too lax on this type of transmitter?

Go to your local Ham Radio store and get a charger for the IC-2S or IC-24 series walkies. Better yet, get the fast charger. You will probably need the bottom adaptor as an interface. Take the R1 with you and they will be able to set you up.

I must be the exception that makes the rule.. :-)

I can't carry a note in a covered basket and I can read CW, although...

I'm an ex-USN radioman and the way the Navy teaches it is to beat it into your head for a couple of weeks (It seemed like 8 hours a day for the first week).

And although I like copy CW, I also think that a change needs to be made.
If Amatuer Radio is going to continue, it is going to have to attract people and "I" think that CW "can" be a stumbling block for a lot of people.
Just my 2 cents..

Jerry (ex-WB7RHQ and soon ??)

Very funny. I can jam police radios, broadcast remotes, taxi services,
fire departments ... but I can't use an oddball offset conveniently, inside
or outside the ham bands. Bravo.

I suppose if I one of my alligator clips broke while I was soldering onto
it, you'd say that radio shack found a way to keep me from unlawfully
using it to smoke dope!

I hate to ruin your day, Stark, but ICOM purposefully designs radios so that
a simple mod will allow transmission outside the ham bands. There's money
in it, so they do it. My friends and I buy them because of it.

Hey, some people select a car that can do 135 mph over an otherwise similar
car that can only do 80. Go to rec.autos.driving and bother them for a while!

Rich Bono, if you are reading, THIS is the kinda guy I was talking about.

>WHAT!!?!? Is he hallucinating? When did the ARRL invest in a shortwave
>broadcast station?

You must not read QST! :-)
The shortwave broadcast station he's talking about has call letters W1AW.
They recently had Harris equip it with commercial transmitters. I don't
disagreed with their decision to go with commercial grade transmitters,
by the way. As to it being a broadcast station, read the article in QST about
how the computers fire up the transmitters to BROADCAST their bulletins
without monitoring the frequency first. This is my only objection to their
operations. There has been debate here before as to the legallity of
automated QRM so I won't go into that. Many hams feel the service out
weighs the interference. I do too, even though I still think it sets a
bad example of poor operating practice.

I come from Lima, Peru where officers are killed constantly.
Unfortunately the officers don't carry portable radios like here. However
when a officer is shot the police highly appreciate people calling in for

help from the squads radio if the policeman was not on foot patrol.

Unfortunately people panic and are afraid to go near police car because of the risk they encounter doing it. (A police squad may come to the scene and see a wounded officeer and a civilian *terrorist* in the car and shoot him.) I would say that if you are willing to take this risk go ahead, but remember that many countries have delicate situations and anything ould happpen.
